# Table of Contents

<b>1.0 General</b> .....	<b>1</b>
1.1 Introduction.....	1
1.2 Glossary .....	1
1.3 Caution.....	1
<b>2.0 Outline of the Drive</b> .....	<b>3</b>
<b>3.0 Fixed-disk Subsystem Description</b> .....	<b>5</b>
3.1 Control Electronics .....	5
3.2 Head Disk Assembly .....	5
3.3 Actuator .....	5
<b>4.0 Drive Characteristics</b> .....	<b>7</b>
4.1 Formatted Capacity.....	7
4.2 Data Sheet .....	7
4.3 Inquiry Information.....	8
4.3.1 Product ID.....	8
4.3.2 World Wide ID - Block Assignment .....	8
4.4 Cylinder allocation.....	9
4.5 Performance characteristics .....	10
4.5.1 Mechanical positioning.....	11
4.5.2 Drive ready time .....	13
4.5.3 Spindle stop time .....	13
4.5.4 Data transfer speed.....	13
4.5.5 Buffering operation (read ahead/write cache).....	14
<b>5.0 Data Integrity</b> .....	<b>15</b>
5.1 Equipment Status .....	15
5.2 Error Recovery Procedure.....	15
<b>6.0 Physical Format</b> .....	<b>17</b>
6.1 Shipped Format (P-List) .....	17
6.2 Reassigned Format (G-List).....	17
<b>7.0 Electrical Interface</b> .....	<b>19</b>
7.1 FC-AL Connector .....	19
7.1.1 40 pin SCA-2 SFF-8045 FC-AL Connector Definition.....	19
7.1.2 Voltage and Ground Signals .....	20
7.1.3 Fault LED Out .....	20
7.1.4 Ready LED Out .....	20
7.1.5 Start Mated Controls.....	21
7.1.6 SEL_n and Enclosure Service Signals.....	21
7.1.7 -ENBL_BY CH1, -ENBL_BY CH2.....	23
7.1.8 -Drive Present.....	23
7.1.9 Dev_Ctrl_Code_x .....	23
<b>8.0 Environment</b> .....	<b>25</b>
8.1 Temperature and humidity.....	25
8.2 Storage requirements .....	26

8.2.1 Packaging.....	26
8.2.2 Storage time.....	26
8.3 Corrosion test.....	26
8.4 Cooling requirements.....	27
<b>9.0 DC Power Requirements.....</b>	<b>29</b>
9.1 Power Supply Current, Average and Peak.....	30
9.2 Ripple Voltage.....	32
9.3 Power Consumption Efficiency Index.....	32
<b>10.0 Reliability.....</b>	<b>33</b>
10.1 Start/Stop Cycles.....	33
10.2 Data Reliability.....	33
10.3 Seek errors.....	33
10.4 Failure prediction (PFA/S.M.A.R.T).....	33
10.5 Preventive Maintenance.....	33
10.6 Temperature Warning.....	33
<b>11.0 Mechanical Specifications.....</b>	<b>35</b>
11.1 Outline.....	35
11.2 Mechanical Dimensions.....	35
11.3 Interface Connector.....	37
11.4 Mounting Positions and Tappings.....	38
11.5 Drive Mounting.....	40
11.6 Heads Unload and Actuator Lock.....	40
<b>12.0 Vibration and Shock.....</b>	<b>41</b>
12.1 Operating Vibration.....	41
12.1.1 Random Vibration.....	41
12.1.2 Swept Sine Vibration.....	41
12.2 Non-operating Vibrations.....	41
12.2.1 Random Vibration.....	41
12.2.2 Swept Sine Vibration.....	41
12.3 Operating shock.....	41
12.4 Non-operating shock.....	42
12.4.1 Half sinewave shock pulse.....	42
12.4.2 Rotational shock.....	42
<b>13.0 Acoustics.....</b>	<b>43</b>
13.1 Sound power levels.....	43
<b>14.0 Identification.....</b>	<b>45</b>
14.1 Labels.....	45
<b>15.0 Electromagnetic Compatibility.....</b>	<b>47</b>
15.1 Class A Regulatory Notices.....	48
<b>16.0 Standards.....</b>	<b>51</b>
16.1 UL and C-UL Standard Conformity.....	51
16.2 European Standards Compliance.....	51
16.3 German Safety Mark.....	51
16.4 Flammability.....	51
16.5 Corporate Standards Compliance.....	51
<b>17.0 FC-AL attachment.....</b>	<b>53</b>

17.1	Fundamentals .....	53
17.1.1	Node and Port names .....	54
17.1.2	NL_Port address .....	54
17.1.3	Primitive signals and sequences .....	55
17.1.4	Frames.....	56
17.1.5	Sequences.....	56
17.1.6	Exchanges .....	57
17.2	Basic Link Services .....	57
17.2.1	Abort sequence (ABTS).....	57
17.2.2	Basic accept (BA_ACC).....	58
17.2.3	Basic reject (BA_RJT).....	59

# 1.0 General

## 1.1 Introduction

This document describes the specifications of the following Hitachi 3.5 inch FC-AL drives.

**Table 1: Product ID table**

Product ID	Description
HUS153030VLF400	300 GB, FC-AL
HUS153014VLF400	147 GB, FC-AL
HUS153073VLF400	73 GB, FC-AL

**Note:** The specifications in this document are subject to change without notice.  
For technical and ordering information, please visit our website at <http://www.hitachigst.com>.

## 1.2 Glossary

Word	Meaning
BMS	Background Media Scan
Kb	Kilobit = 1000 bits
Mb	Megabit = 1,000,000 bits
GB	Gigabyte = 1,000,000,000 bits
HDD	Hard Disk Drive
MB	Megabyte = 1,000,000 bytes
KB	Kilobyte = 1000 bytes
PFA	Predictive Failure Analysis
SAS	Serial Attached SCSI
S.M.A.R.T.	Self-Monitoring and Reporting Technology
LVD	Low Voltage Differential SCSI
FC-AL	Fibre Channel - Arbitrated Loop

## 1.3 Caution

This drive can be damaged by ESD (Electric Static Discharge). Any damages incurred to the drive after its removal from the shipping package and the ESD protective bag are the responsibility of the user.

## 2.0 Outline of the Drive

- Storage capacities of 300 GB, 147 GB, 73 GB
- Dual 4.250/2.1250/1.0625 Gb/s Fibre Channel Arbitrated Loop-2 host interfaces
- Supports dual-ported operations
- Supports full duplex operations
- Login BB\_Credit=0
- Enclosure Service Interface (ESI, SFF-8045 Rev. 4.2) and Enclosure Initiated ESI (SFF-8067 Rev. 2.6) compliant
- Variable Sector Size (512,520,528 bytes/ sector)
- Tagged Command Queuing support
- Automatic read/write data transfer
- 3.6 ms seek time in read operation for 300 GB
- 3.4 ms seek time in read operation for 147 GB
- 3.4 ms seek time in read operation for 73 GB
- Adaptive read ahead algorithm
- Write Cache
- Back to back write
- ECC On The Fly correction
- Automatic defect reallocation
- Self diagnostics at power on
- Closed loop actuator servo
- Non head disk contact start/stop
- 15,000 RPM spindle rotation speed
- Automatic actuator lock
- PFA (S.M.A.R.T.)
- ANSI T10 Protection Information (End-to-End)

## 3.0 Fixed-disk Subsystem Description

### 3.1 Control Electronics

The drive is electronically controlled by a microprocessor, logic modules, digital/analog modules and various drivers and receivers. The control electronics perform the following major functions:

- Perform self-checkout (diagnostics)
- Conduct a power-up sequence and calibrate the servo.
- Monitor various timers for head settling, servo failure, etc.
- Analyze servo signals to provide closed-loop control. These include position error signal and estimated velocity.
- Control of the voice coil motor driver to align the actuator onto a desired position
- Monitor the actuator position and determine the target track for a seek operation.
- Constantly monitor error conditions of the servo and take corresponding action if an error occurs.
- Control starting, stopping, and rotating speed of the spindle.
- Control and interpretation of all interface signals between the host controller and the drive
- Control of read/write accessing of the disk media, including defect management and error recovery

### 3.2 Head Disk Assembly

The head/disk assembly (HDA) is assembled in a clean room environment and contains disks, a spindle motor, actuator assembly, and voice coil motor. Air is constantly circulated and filtered when the drive is operational. Venting of the HDA is accomplished via a breather filter.

The spindle is driven directly by a brushless, sensorless DC drive motor. Dynamic braking is used to stop the spindle quickly.

### 3.3 Actuator

The read/write heads are mounted in the actuator. The actuator is a swing-arm assembly driven by a voice coil motor. A closed-loop positioning servo controls the movement of the actuator. An embedded servo data pattern supplies feedback to the positioning servo to keep the read/write heads centered over the desired track.

The actuator assembly is balanced to allow vertical or horizontal mounting without adjustment.

Heads are moved out from the disks (unloaded) to protect the disk data during shipping, moving, or storage. At power down, the heads are automatically unloaded from over the disk area and the head actuator locking mechanism will secure the heads in the unload position.

## 4.0 Drive Characteristics

### 4.1 Formatted Capacity

Table 2: Formatted Capacity

Description	HUS153030VLF400	HUS153014VLF400	HUS153073VLF400
Label capacity	300 GB	147 GB	73 GB
Number of heads	8	4	2
Number of disks	4	2	1
Total data bytes (512 bytes/sector)	300,000,739,328	147,015,821,824	73,407,900,160
Total logical data blocks	585,937,500 (22ECB25C)	287,140,277 (111D69B5h)	143,374,805 (88BB9D5h)

### 4.2 Data Sheet

Table 3: Data Sheet

Buffer to/from media	864 - 1441 [Mb/sec]
Host to / from buffer (interface transfer rate)	106.25 MB/s (1 Gb/s) 212.5 MB/s (2 Gb/s) 425.0MB/s (4Gb/s)
Data buffer size	16MB
Number of buffer segments	1 - 254
Rotational speed	15,000 RPM
Recording density	824.5 [Kbpi] (Max)
Track density	137,000 [TPI] (average)
Areal density	113 [Gb/sq. in.]
Data zone	20

## 4.3 Inquiry Information

### 4.3.1 Product ID

Product ID in Section 19.5.1.1, “Inquiry Data Format - EVPD = 0, Page Code = 0” on page 126, is as follows:

**Table 4: Product ID in Inquiry Command**

Product ID	Description
HUS153030VLF400	300 GB, FC-AL
HUS153014VLF400	147 GB, FC-AL
HUS153073VLF400	73 GB, FC-AL

### 4.3.2 World Wide ID - Block Assignment

Block Assignment of World Wide ID is as follows:

**Table 5: Block assignment of World Wide ID in INQUIRY Command**

Manufacturing Site	Product	Block Assignment
Singapore	HUS153030VLF400	001h <sup>(1)</sup>
	HUS153014VLF400	001h <sup>(1)</sup>
	HUS153073VLF400	001h <sup>(1)</sup>

Note (1) - Additional block assignment will be issued as needed based on actual production volume.

## 4.4 Cylinder allocation

Table 6: Cylinder allocation

Cylinder Allocation ( all models)				
Zone	Sectors/Track	Cyln/zone	Start Cyln	End Cyln
0	1080	14817	1	14818
1	1041	2503	14819	17321
2	1026	4806	17322	22127
3	1012	3904	22128	26032
4	990	5106	26033	31138
5	972	2303	31139	33441
6	918	7109	33442	40550
7	900	6608	40551	47158
8	877	3304	47159	50462
9	864	1501	50464	51964
10	855	601	51965	52565
11	810	10012	52566	62578
12	765	2803	62579	65381
13	756	1702	65382	67083
14	742	2203	67084	69286
15	720	4004	69287	73291
16	702	2103	73292	75394
17	675	4704	75395	80099
18	648	1401	80101	81501
19	630	1802	81502	83303

**Note:** Values shown are nominal. Actual values will vary based on manufacturing optimization. Mode Page 03 (Format Device Parameters), page 180 and Mode Page 0C (Notch Parameters), page 188 provide methods to determine actual medium format and zone parameters for specific drives.

## 4.5 Performance characteristics

Drive performance is characterized by the following parameters:

- Command overhead
- Mechanical head positioning
  - Seek time
  - Latency
- Data transfer speed
- Buffering operation (read ahead/write cache)

**Note:** All the above parameters contribute to drive performance. There are other parameters that contribute to the performance of the actual system. This specification tries to define the bare drive characteristics, not system throughput, which depends on the system and the application.

## 4.5.1 Mechanical positioning

### 4.5.1.1 Average seek time (including settling)

Table 7: Mechanical positioning performance

Model	Command	Typical (ms)	Max
300 GB	Read	3.6	4.7
	Write	4.1	5.1
147 GB	Read	3.4	4.6
	Write	3.8	5.1
73 GB	Read	3.4	4.6
	Write	3.9	5.0

“Typical” and “Max” are used throughout this document and are defined as follows:

**Typical** Average of the drive population tested at nominal environmental and voltage conditions.

**Max** Maximum value measured on any one drive over the full range of the environmental and voltage conditions. (See Section 8.0, “Environment” on page 31 and Section 9.0, “DC power requirements” on page 35 for ranges.)

Seek time is measured from the start of the actuator’s motion to the start of a read or write operation. Average seek time is measured as the weighted average of all possible seek combinations.

Weighted average =

$$\begin{aligned}
 &Max \\
 &\sum_{n=1} = \frac{(max + 1 - n) \cdot (Tnin + Tnout)}{(max + 1) \cdot (max)}
 \end{aligned}$$

Where:

- max** = Maximum seek length
- n** = Seek length (1 to max)
- Tn.in** = Inward measured seek time for an n track seek
- Tn.out** = Outward measured seek time for an n track seek

### 4.5.1.2 Full stroke seek time

Model	Command	Typical (ms)	Max
300 GB	Read	6.6	11.1
	Write	7.1	11.5
147 GB	Read	6.5	11.0
	Write	6.8	11.6
73 GB	Read	6.5	11.0
	Write	6.9	11.4

Full stroke seek is measured as the average of 1,000 full stroke seeks with a random head switch from both directions (inward and outward).

### 4.5.1.3 Average latency

Table 8: Latency time

Rotation	Time for a revolution (ms)	Average latency (ms)
15,000 RPM	4.0	2.0

## 4.5.2 Drive ready time

**Table 9: Drive ready time**

Model	Typical (sec)	Maximum (sec)
300 GB Model	21.0	29.9
147 GB Model	11.5	29.9
73 GB Model	7.0	29.9

## 4.5.3 Spindle stop time

**Table 10: Spindle stop time**

Model	Typical (sec)	Maximum (sec)
300 GB Model	11.0	20
147 GB Model	7.0	20
73 GB Model	4.0	20

The period from power off to the complete stop of the rotating spindle is categorized as 'operating'. The Operating shock criteria apply during this period. Refer to section 12.3, “Operating shock” on page 41.

## 4.5.4 Data transfer speed

**Table 11: Data transfer speed (sector size 512 Byte case)**

Description	Zone	Model	Typical (MB / Sec)	
			Read	Write
<b>Disk-buffer transfer</b>				
Instantaneous	0	All	138.2	138.2
Measured typical values for sustained disk-buffer transfer rate	0	300 GB	123.0	120.0
	0	147 GB	123.0	120.0
	0	73 GB	123.0	120.0

Instantaneous	19	All	80.6	80.6
Measured typical values for sustained disk-buffer transfer rate	19	300 GB	71.7	69.9
	19	147 GB	71.7	69.9
	19	73 GB	71.7	69.9

### Notes:

- Instantaneous disk-buffer transfer rate is derived by: (Number of sectors on a track) x 512 x (revolutions/sec)
- For this table, '1 MB / Sec' should be interpreted as 1,000,000 bytes per Second.
- The number of sectors per track will vary by zone because of the linear density recording.
- Sustained disk-buffer transfer rate is the average rate measured while transferring multiple cylinders of data. It differs from the instantaneous transfer rate because of the time required to change tracks (Cylinder skew and Head skew). In addition, time is added for the occasional missed transfer.

### **4.5.5 Buffering operation (read ahead/write cache)**

This hard disk drive has a buffer for read ahead (see Segmented Caching, page 331).

## 5.0 Data Integrity

The drive retains recorded information under all non-write operations.

No more than one sector can be lost by power down during a write operation while write cache is disabled. If power down occurs before completion of a data transfer from write cache to disk while write cache is enabled, the data remaining in the write cache will be lost. To prevent this data loss at power off, the following action is recommended:

- Confirm successful completion of a SYNCHRONIZE CACHE (35h) command

## 5.1 Equipment Status

Equipment status is available to the host system any time the drive is not ready to READ, WRITE or SEEK. This status normally exists at power-on time and will be maintained until the following conditions are satisfied:

- Access recalibration/tuning is complete
- Spindle speed meets requirements for reliable operations
- Self-check of drive is complete

Appropriate error status is made available to the host system if any of the following conditions occur after the drive has become ready:

- Spindle speed goes outside of requirements for reliable operation
- “Write fault” is detected

## 5.2 Error Recovery Procedure

Errors occurring with the drive are handled by the error recovery procedure.

Errors that are uncorrectable after application of the error recovery procedures are reported to the host system as non-recoverable errors.

## 6.0 Physical Format

Media defects are remapped to the next available sector during the Format Process in manufacturing. The mapping from Logical Block Address (LBA) to the physical Block locations is calculated using internally maintained tables.

### 6.1 Shipped Format (P-List)

- Data areas are optimally used.
- All pushes generated by defects are absorbed by available tracks of the inner notch.

### P-List Physical Format

#### Plist physical format

**Note:** Defects are skipped without any constraint, such as track or cylinder boundary. The calculation from LBA to physical is done automatically by internal table.

### 6.2 Reassigned Format (G-List)

- G-List has a capacity of 5000 Customer LBAs.
- Multiple reassignments of the same Customer LBA do not increase the number of G-List entries.
- A track for spare sectors is inserted after every 800 nominal customer tracks.

# 7.0 Electrical Interface

## 7.1 FC-AL Connector

The drive conforms to SFF specifications 8045, 8067 and 8451. The SFF 8045/8067 documents defines the electrical specification and SFF-8451 defines the mechanical specification. The only difference between SFF-8045 and SFF-8067 is the Enclosure Service Interface. The drive will 'discover' the level of Enclosure Service Interface supported by the enclosure, and use the proper level for enclosure communication. This 'discovery' process is defined in the SFF-8067 specification.

The connector is expected to be used in an environment which uses a common connector structure for racking disk drives in a cabinet. The connector allows for plugging a drive directly into a backplane by providing the necessary electrical connection. Mechanical stability and device retention must be provided by a mechanism outside the drive.

The signals defined in this connector include:

- Dual ported Fibre Channel In/Out control signals
- +5V and +12V power
- ID select
- Motor start control
- LED drive signals
- PBC Interlock control
- Fibre Channel link rate selection/Hard Reset
- Power control

### 7.1.1 40 pin SCA-2 SFF-8045 FC-AL Connector Definition

The drive uses the connector compatible with the SFF-8045 connector specifications. The connector contact assignment is shown in following table.

**Table 12: 40-pin Connector Signal Definition**

Signal Name	Pin #	Pin #	Signal Name
-ENBL BYP CH1	1	21	12V Charge
12 Volts	2	22	12V Ground
12 Volts	3	23	12V Ground
12 Volts	4	24	+Port 1_In
-Parallel ESI	5*	25	-Port 1_In
-Drive Present	6	26	12V Ground
Ready LED Out	7	27	+Port 2_In
Power Control	8	28	-Port 2_In
Start_1/Mated	9	29	12V Ground
Start_2/Mated	10	30	+Port 1_Out
-ENBL BYP CH2	11	31	-Port 1_Out
Sel_6/-EFW	12*	32	5V Ground
Sel_5/-P_ESI_5	13*	33	+Port 2_Out

Sel_4/-P_ESI_4	14*	34	-Port 2_Out
Sel_3/-P_ESI_3	15*	35	5V Ground
Fault LED Out	16	36*	Sel_2/-P_ESI_2
Dev_Ctrl_Code_2	17	37*	Sel_1/-P_ESI_1
Dev_Ctrl_Code_1	18	38*	Sel_0/-P_ESI_0
5 Volts	19	39	Dev_Ctrl_Code_0
5 Volts	20	40	5V Charge

**Note:** The guide pins are connected to 5V ground.

\* Definition changes for SFF-8067

## 7.1.2 Voltage and Ground Signals

The 12 V and 5 V contacts provide all of the voltages required by the drive. The two voltages share a common ground plane to which all of the ground contacts are connected.

## 7.1.3 Fault LED Out

As specified in the SFF-8045 specification, the Fault LED is driven under the following conditions:

- both enable bypass signals are asserted by the drive
- an internal failure has been detected by the drive
- the drive has been instructed by the host to turn on the LED

The drive provides an open-collector TTL driver with up to 30mA of current sink capability to the drive fault LED. The cathode of the LED should be connected to this signal. The LED and the current-limiting resistor must be provided by the enclosure.

## 7.1.4 Ready LED Out

As specified in the SFF-8045 specification, the Ready LED Out signal has the following definition (per the Hot Plug Implementation):

- Drive not mated:
  - The signal is de-asserted (i.e. high). The LED is off.
- Drive mated, motor not spinning:
  - The signal is asserted (i.e. low) for a period long enough to be detected by the observer whenever a SCSI command is received. The LED is normally off.
- Drive mated, spinning up or down:
  - The signal is alternately asserted and de-asserted for a period of 1/2 second. The LED is flashing.
- Drive mated, motor spinning:
  - The signal is normally asserted continuously. The signal is de-asserted for a period long enough to be detected by an observer, whenever a SCSI command is received. The LED is usually on.

The drive provides an open-collector TTL driver with up to 30mA of current sink capability to the Ready LED Out signal. The cathode of the LED should be connected to this signal. The LED and the current-limiting resistor must be provided by the enclosure.

## 7.1.5 Start Mated Controls

The Start\_X Mated signals are TTL inputs to the drive and have 10K ohm pull-up resistors.

As per the SFF-8045 specification, the 'Start\_x Mated' function is implemented as in the following table. Please refer to SFF-8045 for a more complete definition.

**Table 13: Start/Mated Controls**

Start_2 Mated	Start_1 Mated	Spin Function
Open	Open	Drive is not mated. No spin-up will occur.
Open	Gnd	The motor will spin up with the SCSI Unit Start Cmd
Gnd	Open	The motor will spin up after a delay of 6 times the modulo 8 of Sel_ID (in seconds)
Gnd	Gnd	The motor will spin up after drive initialization

## 7.1.6 SEL\_n and Enclosure Service Signals

These signals have different definitions depending on the state of -Parallel ESI and the level of enclosure service supported by the backplane.

### 7.1.6.1 SEL\_n and Enclosure Service Signals

-Parallel ESI is a TTL open-drain output from the drive. It is used to establish the definition of the SEL\_n signals. When -Parallel ESI is de-asserted (high), the backplane shall preset SEL\_ID information on these signals (within 1usec). When -Parallel ESI is asserted (low), the backplane (if supported) will present enclosure service information on these signals (within 1usec). The drive will then go through a 'discovery' phase to determine the level of enclosure services that the backplane supports (i.e. none, SFF-8045, or SFF-8067) and behave accordingly.

### 7.1.6.2 SEL\_ID Function

The SEL\_n (TTL compatible) inputs (defined when -Parallel ESI is de-asserted) provide a binary value of loop identifier to the drive. These 7 signals define 128 possible values and are directly translated into an 8 bit hard AL\_PA via the table below. Only AL\_PA's with neutral disparity are valid values. The drive will attempt to acquire this hard AL\_PA for its own during the LIHA phase of the loop initialization process (LIP).

**Table 14: SEL\_ID/AL\_PA**

SEL_ID	AL_PA	SEL_ID	AL_PA	SEL_ID	AL_PA	SEL_ID	AL_PA
0	EF	20	B2	40	72	60	3A
1	E8	21	B1	41	71	61	39
2	E4	22	AE	42	6E	62	36
3	E2	23	AD	43	6D	63	35
4	E1	24	AC	44	6C	64	34
5	E0	25	AB	45	6B	65	33
6	DC	26	AA	46	6A	66	32
7	DA	27	A9	47	69	67	31

8	D9	28	A7	48	67	68	2E
9	D6	29	A6	49	66	69	2D
A	D5	2A	A5	4A	65	6A	2C
B	D4	2B	A3	4B	63	6B	2B
C	D3	2C	9F	4C	5C	6C	2A
D	D2	2D	9E	4D	5A	6D	29
E	D1	2E	9D	4E	59	6E	27
F	CE	2F	9B	4F	56	6F	26
10	CD	30	98	50	55	70	25
11	CC	31	97	51	54	71	23
12	CB	32	90	52	53	72	1F
13	CA	33	8F	53	52	73	1E
14	C9	34	88	54	51	74	1D
15	C7	35	84	55	4E	75	1B
16	C6	36	82	56	4D	76	18
17	C5	37	81	57	4C	77	17
18	C3	38	80	58	4B	78	10
19	BC	39	7C	59	4A	79	F
1A	BA	3A	7A	5A	49	7A	8
1B	B9	3B	79	5B	47	7B	4
1C	B6	3C	76	5C	46	7C	2
1D	B5	3D	75	5D	45	7E	1
1E	B4	3E	74	5E	43	7E	NA
1F	B3	3F	73	5F	3C	7F	-

**Note:** All values are in hex format. An AL\_PA value of 0x00 is not valid for an NL\_Port. A SEL\_ID of 0x7F forces the drive to obtain a soft address.

### 7.1.6.3 P\_ESI\_n Function

The SEL\_N (TTL compatible) I/O's (defined when -Parallel ESI is asserted) provide an interface between the enclosure and the drive. When signals are defined as outputs, they are configured as open-drain drivers with 4mA sink capability.

When the drive asserts -Parallel ESI, it goes through a 'discovery' process (see SFF-8067) to determine the level of enclosure service supported by the backplane. The outcome of the 'discovery' process is that the backplane:

1. Does not support enclosure services or
2. Supports SFF-8045 enclosure services or
3. Supports SFF-8067 enclosure services

The definition of the signals are summarized in the table below:

**Table 15: SEL\_N/P\_ESI\_N Signal Definition**

-Parallel ESI	-Parallel ESI asserted (low)	
de-asserted (high)	SFF-8045*	SFF-8067*
Sel_0 (input)	P_ESI_0 (input)	Data(0) (bi-di**)
Sel_1 (input)	P_ESI_1 (input)	Data(1) (bi-di**)
Sel_2 (input)	P_ESI_2 (input)	Data(2) (bi-di**)
Sel_3 (input)	P_ESI_3 (input)	Data(3) (bi-di**)
Sel_4 (input)	P_ESI_4 (input)	-ENCL_ACK (output)
Sel_5 (input)	P_ESI_5 (input)	-DSK_RD (input)
Sel_6 (input)	-EFW (input)	-DSK_WR (input)

**Note:** \* level of backplane support as established in 'discovery'  
 \*\* the direction is determined by the state of DSK\_RD and DSK\_WR  
 all signals are assumed valid 1 usec after -Parallel ESI changes state

#### 7.1.6.4 SFF-8045 Enclosure Service Interface

The SFF-8045 Enclosure Service Interface defines 7 bits of enclosure status. This status is read by the drive, and presented to the initiator, upon receipt of the appropriate SCSI RECEIVE DIAGNOSTIC command. The definitions of the status bits are vendor specific. The drive does not try to interpret the status. The drive assumes -EFW is status and treats it as it does the other P\_ESI\_n signals.

#### 7.1.6.5 SFF-8067 Enclosure Service Interface

The SFF-8067 Enclosure Service Interface defines a bidirectional communication path between the backplane and the drive. Read Communications are invoked by the drive upon receipt of the appropriate SCSI RECEIVE DIAGNOSTIC command. This has the system level effect of the host reading information from the enclosure. Write Communications are invoked by the drive upon receipt of the appropriate SCSI SEND DIAGNOSTIC command. This has the system level effect of the host writing information to the enclosure. The meaning of the information is vendor specific. The drive does not try to interpret the information. See the SFF-8067 Specification for a detailed description of the communication protocol.

#### 7.1.7 -ENBL\_BYP\_CH1, -ENBL\_BYP\_CH2

These TTL outputs from the drive provide 4mA of sink capability. They are intended to control the state of a loop port bypass circuit on the backplane. The drive powers up with these signals turned off. It is assumed that the backplane will provide a 1Kohm pull-down resistor that will ensure the drive is bypassed on the loop when it is not present, or when it is powering up. After a successful power-up, the drive will attempt to enable itself on both loops (if allowed to do so via SCSI mode page 19h). These signals are also controllable by the host with the LPB and LPE fibre channel primitives.

#### 7.1.8 -Drive Present

This signal is connected to the drive's ground plane. The backplane can use this signal to detect the presence of the drive.

#### 7.1.9 Dev\_Ctrl\_Code\_x

The signals DEV\_CTRL\_CODE\_2 through DEV\_CTRL\_CODE\_0 provide a binary code to the drive to control functions such as FC link rate, Power Failure Warning (PFW) and Hard Reset. The control function is either identified by a code or a sequence of codes on the DEV\_CTRL\_CODE signals. The table below defines the functions and assigned codes that use a

decode of the value on the DEV\_CTRL\_CODE signals.

The Hard Reset function uses a sequence of values on the DEV\_CTRL\_CODE signals. The sequence is 5, 1, 3, 2, 3, 1, 5. A drive detecting a valid Hard Reset sequence shall perform the equivalent of a power-on-reset.

10 Kohm pull up resistors to 3.3 VOLTS are provided on the drive for both DEV\_CTRL\_CODE\_2, DEV\_CTRL\_CODE\_1 and DEV\_CTRL\_CODE\_0 to be sure that each signal is maintained in its high state unless a low is provided from the back-plane.

For more information refer to the SFF-8045 Specification.

**Table 16: DEV\_CTRL\_CODE\_N Signal Definition**

Link Rate	DEV_CTRL_CODE_2	DEV_CTRL_CODE_1	DEV_CTRL_CODE_0
1.0625 GHz	1	1	1
2.1250 GHz	1	1	0
4.250 GHz	1	0	1
Reserved	1	0	0
Reserved	0	1	1
Reserved	0	1	0
Reserved	0	0	1
Power Failure Warning	0	0	0

# 8.0 Environment

## 8.1 Temperature and humidity

Table 17: Operating and non-operating conditions

<b>Operating conditions</b>	
Ambient Temperature	5°C to 55°C (see note)
Relative humidity	5 to 90%, non-condensing
Maximum wet bulb temperature	29.4°C, non-condensing
Maximum surface temperature gradient	20°C/hour
Altitude	-305 to 3,048 m
<b>Shipping conditions</b>	
Ambient Temperature	-40°C to 70°C
Relative humidity	5 to 95%, non-condensing
Maximum wet bulb temperature	35°C, non-condensing
Maximum surface temperature gradient	30°C/hour
Altitude	-305 to 12,192 m
<b>Storage conditions</b>	
Ambient Temperature	0°C to 65°C
Relative humidity	5 to 90%, non-condensing
Maximum wet bulb temperature	35°C, non-condensing
Altitude	-305 to 12,192 m

## 8.2 Storage requirements

### 8.2.1 Packaging

The drive or option kit must be heat-sealed in a moisture barrier bag with desiccant inside the bag supplied by Hitachi Global Storage Technologies.

### 8.2.2 Storage time

Cumulative storage time in the package must not exceed one year. If a longer storage time is required, the drive must be repackaged with new desiccant or moved to a climatically controlled environment.

After the drive is unpackaged, it must not remain inoperative for longer than six months.

## 8.3 Corrosion test

The hard disk drive shows no signs of corrosion inside or outside of the hard disk assembly and remains functional after being exposed to a temperature of 50°C and relative humidity of 90% for seven days.

## 8.4 Cooling requirements

Drive component surface temperatures must remain within the limits specified in the following table. The drive may require forced air cooling to meet specified operating temperatures.

**Table 18: Maximum allowable surface temperatures**

Module name	Location	Maximum allowable surface temperature
MPU/HDC Integration module	1	108°C
DRAM	2	85°C
VCM & spindle driver	3	108°C
Channel	4	115°C
HDD base casting	as noted in picture	60°C

Recommended Temperature Measurement Location

## 9.0 DC Power Requirements

The following voltage specification applies at the drive power connector. Connections to the drive should be made in a safety extra low voltage (SELV) circuit. There is no power on or power off sequencing requirement.

Adequate secondary over-current protection is the responsibility of the system. A 10 A limit is required for safety purposes.

**Table 19: Input Voltage**

	<b>Tolerance</b>	<b>Absolute Max Spike Voltage</b>	<b>Supply Rise Time</b>
+5 Volts Supply	+/- 5%	5.5 V	0-200 ms
+12 Volts Supply	+/- 5%	15 V	0-400 ms

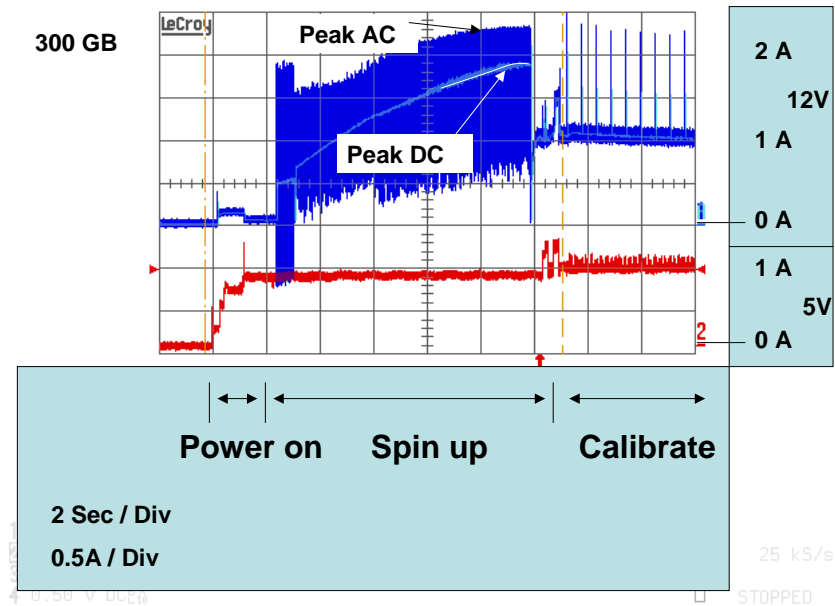

**Note:** -8% is acceptable during spin up, but the spin up time is not guaranteed.

**CAUTION:** *To avoid damage to the drive electronics, power supply voltage spikes must not exceed 5.5V.*

# 9.1 Power Supply Current, Average and Peak

The following current and power requirements are typical when operating under the following conditions: Nominal 5 and 12V, Background Media Scan (BMS) disabled for Idle, Write Caching disabled and the drive reporting a temperature of 45C.

Model FC 4Gb	300 GB IO /Sec	Current		Power Watts	Note
		+5V	+12V		
Start Peak DC		---	1.85	---	
Start Peak AC		1.30	2.50	---	
Idle		0.86	0.82	14.1	Average

BMS Peak		1.43		

## 9.2 Ripple Voltage

**Table 20: Power Supply Generated Ripple at Drive Power Connector**

	<b>Maximum (mV pp)</b>	<b>MHz</b>
+5 V DC	250	0-10
+12 V DC	250	0-10

During drive start up and seek, 12 volt ripple is generated by the drive (referred to as dynamic loading). If the power of several drives is daisy chained, the power supply ripple plus other drive dynamic loading must remain within the regulation tolerance of +5%. A common supply with separate power leads to each drive is a more desirable method of power distribution.

To prevent external electrical noise from interfering with the drive's performance, the drive must be held by four screws in a user system frame that has no electrical level difference at the four screw positions. The drive enclosure must not be used in the current return path of the drive power supply. The maximum common-mode noise current passing through the drive must not exceed 20 mA.

## 9.3 Power Consumption Efficiency Index

**Table 21: Power Consumption Efficiency Index**

<b>Model</b>	<b>300GB Model</b>	<b>147 GB Model</b>	<b>73 GB Model</b>
Power Consumption Efficiency Index -Idle Mode (W/GB)	0.047	0.073	0.122

## 10.0 Reliability

### 10.1 Start/Stop Cycles

The drive is designed to withstand a minimum of 50,000 start/stop cycles at ambient environment.

The drive is designed to withstand a minimum of 10,000 start/stop cycles at the operating environment conditions specified in “Environment” on page 25.

### 10.2 Data Reliability

The probability of an uncorrectable data error is 1 in  $10^{16}$  bits read.

ECC implementation:

- 1 symbol = 10 bits
- 1 interleave
- 20 symbols, On-The-Fly correction
- Up to 38 symbols (total) Off-Line correction with burst error information
- LBA seeded 32 bit CRC for ECC miscorrect detection

### 10.3 Seek errors

A non-recoverable seek/ID miscompare error is defined as a seek operation that cannot be recovered by the error recovery procedure of the drive. The drive reports sense key 04 and sense code 02 for this error.

No drive has more than one non-recoverable seek/ID miscompare error per 100 million seek operations (1 in  $1 \times 10^8$ ) when operated at the full range of voltage and environmental conditions.

### 10.4 Failure prediction (PFA/S.M.A.R.T)

A recoverable equipment error is an error other than a seek/ID miscompare error or read error that is detected and corrected by the drive error recovery procedure. Examples are *Write Fault*, *Drive Not Ready* and internal drive errors.

No drive has more than one recoverable equipment error per  $10^8$  READ,  $10^8$  WRITE, or  $10^6$  SEEK operations when operated at the full range of voltage and environmental conditions.

Non-recoverable equipment errors indicate a defective drive.

### 10.5 Preventive Maintenance

None.

### 10.6 Temperature Warning

Temperature Warning is enabled by setting the EWASC (Enable Warning Additional Sense Code) bit to 1 and setting DEXCPT (Disable Exception Control) bit to 0 in Mode Page 1C. For mode page settings, refer to Section 19.10.14, “Mode Page 1C (Informational Exceptions Control)” on page 193. The warning is issued as sense data (Sense Key 01h, Code 0Bh, Qual 01h).

The drive temperature is reported in Log Sense page 2F. Refer to Section 19.7.12, “Log Sense Page 2F” on page 159.

# 11.0 Mechanical Specifications

## 11.1 Outline

## 11.2 Mechanical Dimensions

The drive complies with SFF-8301.

**Table 22: Physical Dimensions**

Height [mm]	25.8 ± 0.3	
Width [mm]	101.6 ± 0.25	
Length [mm]	146.2 ± 0.8	
Weight [grams - maximum]	300 GB Model	745 grams
	147 GB Model	714 grams
	73 GB Model	699 grams

LEFT

FRONT

### 11.3 Interface Connector

# 11.4 Mounting Positions and Tappings

(6X) 6-32 UNC

RIGHT

## 11.5 Drive Mounting

The drive will operate in all axes (6 directions). Performance and error rate will stay within specification limits if the drive is operated in the other orientations from which it was formatted.

The recommended mounting screw torque is 0.6 - 1.0 Nm (6 - 10 kgf-cm). The recommended mounting screw depth is 4 mm maximum for bottom and 4.5 mm maximum for horizontal mounting.

To avoid performance degradation, mount the drive in the system securely enough to prevent excessive motion or vibration of the drive at seek operation or spindle rotation, using appropriate screws or equivalent mounting hardware. Consult with the issuer of this specification for actual application if necessary.

Drive level vibration tests and shock tests are to be conducted with the drive mounted to a table using the bottom four screws.

## 11.6 Heads Unload and Actuator Lock

Heads are moved out from the disks (unload) to protect the disk data during shipping, moving or storage. At power down, the heads are automatically unloaded from over the disk area and the head actuator locking mechanism will secure the heads in the unload position.

## 12.0 Vibration and Shock

All vibration and shock measurements in this section are made with a bare drive. The input for the measurements are applied to the normal drive mounting points unless noted otherwise.

### 12.1 Operating Vibration

#### 12.1.1 Random Vibration

The drive is designed to operate without unrecoverable errors while being subjected to the vibration levels as defined below. The assessments are carried out during 30 minutes of random vibration using the power spectral density (PSD) levels as follows.

**No Errors:** 0.4 G RMS, 5-500 Hz, flat PSD profile for each of the three mutually perpendicular axes.

**No Data Loss:** 1.2 G RMS, 5-500 Hz, flat PSD profile for each of the three mutually perpendicular axes.

**Note:** The specified levels are measured at the mounting points.

#### 12.1.2 Swept Sine Vibration

The drive will meet the criterion while operating in the respective conditions as described below.

**No errors:** 0.5 G 0-peak, 5-400-5 Hz sine wave, 0.5 octave/minute sweep rate

**No data loss:** 1.5 G 0-peak, 5-500-5 Hz sine wave, 0.5 octave/minute sweep rate

### 12.2 Non-operating Vibrations

The drive will not sustain permanent damage or loss of recorded data after being subjected to the environments as described below.

#### 12.2.1 Random Vibration

The test consists of a random vibration applied for each of the three mutually perpendicular axes at a time duration of ten minutes per axis.

1.04 G RMS, 5-500 Hz, flat PSD profile

#### 12.2.2 Swept Sine Vibration

The test consists of a swept sine vibration applied for each of the three mutually perpendicular axes.

2.0G 0-peak, 5-500-5 Hz sine wave, 0.5 octave/minute sweep rate

### 12.3 Operating shock

The drive will meet the criterion while operating in the respective conditions as described below.

**No data loss:** 15G, 11 ms duration, half sinewave shock pulse

**No data loss:** 30G, 2 ms duration, half sinewave shock pulse

The shock pulses of each level are applied to the drive, ten pulses for each direction and for all three mutually perpendicular axes. There must be a minimum of thirty seconds delay between shock pulses. The input level is applied to a base plate where the drive is attached using four mounting screws.

## **12.4 Non-operating shock**

The drive will not sustain permanent damage or loss of recorded data after being subjected to the environments as described below.

### **12.4.1 Half sinewave shock pulse**

80 G, 11 ms duration, half sinewave pulse

250 G, 2 ms duration, half sinewave pulse

The shocks are applied in each direction of the drive for the three mutually perpendicular axes, one axis at a time. The input level is applied to a base plate where the drive is attached using four mounting screws.

### **12.4.2 Rotational shock**

30,000 radians /second<sup>2</sup>, 1 ms duration

20,000 radians /second<sup>2</sup>, 2 ms duration

The shock input is applied around the axis of the actuator pivot. The shock input does not displace the heads from the actuator latched position.

# 13.0 Acoustics

## 13.1 Sound power levels

The upper limit criteria of A-weighted sound power levels are given in Bel, relative to one pico watt, and are shown in the following table. The measurement method is in accordance with ISO-7779.

**Table 23: A-weighted sound power levels**

Model	Mode	A-weighted sound power level (Bel)	
		Typical	Maximum
300 GB	Idle	3.5	3.8
	Operating	4.3	4.7
147 GB	Idle	3.5	3.8
	Operating	4.3	4.7
73 GB	Idle	3.5	3.8
	Operating	4.3	4.7

Background power levels of the acoustic test chamber for each octave band are to be recorded. Sound power levels are measured with the drive supported by spacers so that the lower surface of the drive is located at a height of 25 cm from the chamber floor.

No sound-absorbing material shall be used. The acoustical characteristics of the drive subsystem are measured under the following conditions.

**Idle Mode:**

Powered on, disks spinning, track following, unit ready to receive and respond to host commands.

**Operating Mode**

Continuous random cylinder selection and seek operation of the actuator with dwell time at each cylinder. Seek rate for the drive is calculated per the formula below:

$N_s$  = average seek rate in seeks/sec where:

$$N_s = 0.4 / (T_t + T_l)$$

$T_t$  = published random seek time

$T_l$  = time for the drive to rotate by half a revolution

# 14.0 Identification

## 14.1 Labels

The following labels are affixed to every hard disk drive shipped from the drive manufacturing location in accordance with appropriate hard disk drive assembly drawing:

- A label containing Hitachi Global Storage Technologies logo, Hitachi part number and the statement “Made by Hitachi” or Hitachi approved equivalent.
- A label containing drive model number, manufacturing date, formatted capacity, country of origin or Hitachi approved equivalent and UL, C-UL, TUV, CE, MIC, BSMI, CTICK, RoHS and Recycle logos.
- A bar code label containing the drive serial number.
- A user designed label, per agreement
- Interface definition mark, FC-AL-4 Model

The labels may be integrated with other labels.

# 15.0 Electromagnetic Compatibility

The drive, when installed in a suitable enclosure and exercised with a random accessing routine at a maximum data rate will comply with the worldwide EMC requirements listed below.

The drive is designed for system integration and installation into a suitable enclosure for use. As such, the drive is supplied as a subassembly and is not subject to Subpart A of Part 15 of the FCC Rules and Regulations.

The design of the drive serves to minimize radiated emissions when installed in an enclosure that provides reasonable shielding. As such, the drive is capable of meeting FCC Class A limits. However, it is the users responsibility to assure that the drive meets the appropriate EMC requirements in their system. Shielded I/O cables may be required if the enclosure does not provide adequate shielding, with the shields grounded to the enclosure and to the host computer.

## 15.1 Class A Regulatory Notices

### European Union

This product is in conformity with the protection requirements of EU Council Directive 89/336/EEC, as amended by Council Directive 93/68/EEC on the approximation of the laws of the Member States relating to electromagnetic compatibility. Hitachi cannot accept responsibility for any failure to satisfy the protection requirements resulting from a non-recommended modification of the product, including the fitting of non-Hitachi option cards.

This product has been tested and found to comply with the limits for Class A Information Technology Equipment according to European Standard EN 55022. The limits for Class A equipment were derived for commercial and industrial environments to provide reasonable protection against interference with licensed communication equipment.

### Warning

This is a Class A product. In a domestic environment this product may cause radio interference in which case the user may be required to take adequate measures.

### Canada

This Class B digital apparatus complies with Canadian ICES-003.  
Cet appareil numérique de la classe B est conforme à la norme NMB-003 du Canada.

### Germany

Deutschsprachiger EU Hinweis:

Hinweis für Geräte der Klasse A EU-Richtlinie zur Elektromagnetischen Verträglichkeit Dieses Produkt entspricht den Schutzanforderungen der EU-Richtlinie 89/336/EWG zur Angleichung der Rechtsvorschriften über die elektromagnetische Verträglichkeit in den EU-Mitgliedsstaaten und hält die Grenzwerte der EN 55022 Klasse A ein. Um dieses sicherzustellen, sind die Geräte wie in den Handbüchern beschrieben zu installieren und zu betreiben. Des Weiteren dürfen auch nur von der HITACHI empfohlene Kabel angeschlossen werden. HITACHI übernimmt keine Verantwortung für die Einhaltung der Schutzanforderungen, wenn das Produkt ohne Zustimmung der HITACHI verändert bzw. wenn Erweiterungskomponenten von Fremdherstellern ohne Empfehlung der HITACHI gesteckt/eingebaut werden. EN 55022 Klasse A Geräte müssen mit folgendem Warnhinweis versehen werden:

"Warnung: Dieses ist eine Einrichtung der Klasse A. Diese Einrichtung kann im Wohnbereich Funk-Störungen verursachen; in diesem Fall kann vom Betreiber verlangt werden, angemessene Maßnahmen zu ergreifen und dafür aufzukommen."

**Deutschland:** Einhaltung des Gesetzes über die elektromagnetische Verträglichkeit von Geräten Dieses Produkt entspricht dem "Gesetz über die elektromagnetische Verträglichkeit von Geräten (EMVG)". Dies ist die Umsetzung der EU-Richtlinie 89/336/EWG in der Bundesrepublik Deutschland.

Zulassungsbescheinigung laut dem Deutschen Gesetz über die elektromagnetische Verträglichkeit von Geräten (EMVG) vom 18. September 1998 (bzw. der EMC EG Richtlinie 89/336) für Geräte der Klasse A Dieses Gerät ist berechtigt, in Übereinstimmung mit dem Deutschen EMVG das EG-Konformitätszeichen - CE - zu führen. Verantwortlich für die Konformitätserklärung nach Paragraf 5 des EMVG ist die Hitachi Global Storage Technologies, 5600 Cottle road, San Jose, California 95193.

Informationen in Hinsicht EMVG Paragraf 4 Abs. (1) 4:

Das Gerät erfüllt die Schutzanforderungen nach EN 55024 und EN 55022 Klasse A.

## 16.0 Standards

The following shows the safety standards for different countries.

### 16.1 UL and C-UL Standard Conformity

The drive is qualified per ULIEC 60950-1: 2001, First Edition for use in Information Technology Equipment, including Electric Business Equipment. The UL recognition, or the C-UL certification, is maintained for the product life. The UL and C-UL recognition mark appears on the drive.

### 16.2 European Standards Compliance

The product is certified to EN60950.

### 16.3 German Safety Mark

The product is approved by TUV on Test requirement: EN 60950, but the GS mark is not applicable to internal devices such as these drives.

### 16.4 Flammability

The printed circuit boards used in this drive are made of material with a UL recognized flammability rating of V-1 or better. The flammability rating is marked or etched on the board. All other parts not considered electrical components are made of material with a UL recognized flammability rating of V-1 or better.

### 16.5 Corporate Standards Compliance

This product has been designed to meet the following Corporate Standards:

- NB 3-0501-201 Product Safety, National Requirements-All Countries.
- CS 3-0501-070 Electrical, Mechanical and Flammability
- NB 3-0501-033 Product Safety National Certification Conformity Requirement
- CS 1-9700-020 Eco-Product Design Requirement

Hitachi GST encourages owners of information technology (IT) equipment to responsibly recycle their equipment when it is no longer needed. Hitachi GST offers a variety of programs and services to assist equipment owners in recycling their IT products.

## 17.0 FC-AL attachment

This section defines some basic terminology and describes the behavior of the drive when attached to a Fibre Channel Arbitrated Loop.

### 17.1 Fundamentals

This section introduces some of the terminology that is used in describing Fibre Channel and FC-AL.

Fibre Channel is logically a bi-directional serial data channel between two Nodes. Nodes are physically connected by a Link; the point of connection between the link and the node is called a Port.

Ports may be connected point-to-point by a single link or by a switching network (Fabric). If the port is part of the Fabric it is called an F\_Port, otherwise it is an N\_Port.

Fibre Channel is defined in terms of a hierarchy of functions or 'protocol layers'.

- FC-0: Physical Link
- FC-1: Transmission Protocol
- FC-2: Signaling and Framing Protocol
- FC-3: Common Services
- FC-4: Mapping

All layers except FC-4 are defined in

- “Fibre Channel Physical and Signaling Interface (FC-PH)” - ANSI

The Arbitrated Loop is an extension of FC-1 and FC-2 that allows more than two nodes to be connected without the expense of a Fabric. A port that connects to an Arbitrated Loop is generally referred to as an L\_Port. However, the terms NL\_Port and FL\_Port are also used if it is necessary to distinguish whether or not the L\_Port is part of a Fabric. FC-AL is defined in:

- “Fibre Channel Arbitrated Loop (FC-AL)” -ANSI

FC-4, the Mapping layer, defines how other communication protocols (e.g. SCSI, IPI-3, HIPPI) may use Fibre Channel functions. The FC-4 used by The Drive is SCSI-FCP, which is defined in:

- “Fibre Channel Protocol for SCSI (SCSI-FCP)” -ANSI

The 'Disk Profile', recommends which features from the other documents should and should not be implemented in order to ensure compatibility between devices from different manufacturers. The full title of the Disk Profile is:

- “Fibre Channel Private Loop SCSI Direct Attach (FC-PLDA)” -ANSI

An additional document, the ‘Public Loop Profile’, describes the additional features needed to support communication over a FC Fabric Topology. In addition to communicating with devices on their local loop, Public Loop devices can also communicate to devices across a network through the use of a “Fabric Port.” Public Loop behavior is defined in:

- “Fibre Channel - Fabric Loop Attach (FC-FLA)” -ANSI

The Drive complies with the FC-FLA, which makes the following requirements:

1. The upper two bytes of the device’s NL\_Port ID must not be zero.
2. The device must be able to communicate with the Fabric Port i.e., open AL\_PA 0x00.

In addition, the Drive implements FC-FLA as a super-set of the FC-PLDA. Thus, the Drive conforms to FC-PLDA except for those behaviors explicitly defined by the FC-FLA profile. The PLDA makes the following additional requirements.

1. The FC-4 is SCSI-FCP.
2. The Drive provides a Class 3 Fibre Channel service.
  - NO indication of (un)successful class 3 frame delivery is transmitted.
  - Frame flow control is buffer-to-buffer only.
  - Class 1 and 2 frames are ignored.
3. Direct point-to-point attachment with an N\_Port is not supported.

### 17.1.1 Node and Port names

Every Fibre Channel Node and Port in the world must have a unique name. The Drive is a node with two L\_Ports and therefore has a Node\_Name and two Port\_Names.

Both the Node\_Name and Port\_Name are in 64-bit IEEE Registered Name format, as illustrated in Table 24.

**Table 24: IEEE Registered Name format**

Bit				
63-60	59-36	35-24	23-2	1-0
0101	OUI in Canonical Form	Block Assignment	S/N	Object

The Name Address Authority field (0101b) specifies the format used for the rest of the name as follows:

- **OUI** Organizational Unique Identifier (24 bits). Canonical form means that each byte is stored in “bit reversed” order.
- **Block Assignment** Block assignment within Hitachi Global Storage Technologies
- **Object** Node/Port Identifier
  - 00b** Node
  - 01b** Port 1
  - 10b** Port 2
  - 11b** Not assigned
- **S/N** Sequentially increasing drive serial number assigned at manufacturing.

### 17.1.2 NL\_Port address

An NL\_Port address, as illustrated in Table 25, is a 3 byte value that uniquely identifies an NL\_Port on a Fibre Channel network. The Domain and Area bytes are assigned to a NL\_Port by its local FL\_Port. The least significant byte in the NL\_Port address is the Arbitrated Loop Physical Address (AL\_PA), and uniquely identifies a NL\_Port on its local loop.

A Hard AL\_PA is one which is supplied, via the Drive connector, from external switches or jumpers. A Soft AL\_PA is one which is assigned during Loop Initialization

**Table 25: NL\_Port address**

Bits 23-16	Bits 15-8	Bits 7-0
Domain	Area	AL_PA

### 17.1.3 Primitive signals and sequences

The fundamental unit of transfer on a Fibre Channel link is the 8b/10b encoded Transmission Character. Only 256 characters are required to represent a byte of data so the set of valid transmission characters is sub-divided into Data Characters and Special Characters.

A Word is a group of four consecutive transmission characters.

An Ordered Set is a word that starts with a special character (to give word and byte sync) and which has special significance to the communication protocol. Fibre Channel defines the following types of ordered sets:

- Frame delimiters
- Primitive signals
- Primitive sequences

A Frame Delimiter immediately precedes or follows the contents of a frame (see 17.1.4, “Frames” on page 56). Fibre Channel defines the following:

- **SOF** Start of frame
- **EOF** End of frame

A Primitive Signal is an ordered set that has special meaning when received by itself. Fibre Channel defines the following:

- **R\_RDY** Receiver Ready
- **IDLE** Idle

FC-AL adds the following:

- **ARBx** Arbitrate
- **ARB(F0)** Arbitrate
- **OPNyx** Open Full-duplex
- **OPNyy** Open Half-duplex
- **OPNfr** Open Broadcast Replicate<sup>1</sup>
- **OPNyr** Open Selective Replicate<sup>1</sup>
- **CLS** Close
- **MRKtx** Mark<sup>1</sup>

A Primitive Sequence is an ordered set that is transmitted repeatedly and continuously. Three or more of the ordered sets must be received consecutively in order to recognize the primitive sequence. Fibre Channel defines the following:

- **NOS** Not Operational<sup>2</sup>
- **OLS** Offline<sup>2</sup>
- **LR** Link Reset<sup>2</sup>
- **LRR** Link Reset Received<sup>2</sup>

FC-AL adds the following:

- **LPByx** Loop Port Bypass
- **LPEyx** Loop Port Enable

---

1. Since normal buffer-to-buffer flow control is disabled when OPN<sub>r</sub> is used, there is no guarantee that the drive has a buffer available to receive an in-bound frame. It is therefore, recommended that OPN<sub>r</sub> not be used.

2. Used to convey information about a dedicated connection and therefore not relevant to FC-AL. If detected during an open connection, the drive will immediately close. Otherwise it will simply re-transmit.

- **LPEfx** Loop Port Enable all
- **LIP(F7,F7)** Loop Initialization, no valid AL\_PA
- **LIP(F8,F7)** Loop Initialization, loop failure, no valid AL\_PA
- **LIP(F7,AL\_PS)** Loop Initialization, valid AL\_PA
- **LIP(F8,AL\_PS)** Loop Initialization, loop failure, valid AL\_PA
- **LIP(AL\_PD,AL\_PS)** Loop Initialization, reset L\_Port

### 17.1.4 Frames

Information transfer is achieved via frames that are constructed from words and ordered sets. All frames have the same general format, as shown in Table 26.

**Table 26: General frame format**

Field name	SOF	Header	Payload	Fill bytes	CRC	EOF
Field size, # of bytes	4	24	0 to 2048	0 to 3	4	4

The SOF ordered set indicates the start of frame and provides word synchronization.

The Header is the first field after the SOF delimiter. It is used by the link control facility to control link operations, control device protocol transfer, and to detect missing or out of order frames. The header is illustrated in Table 27.

FC-PH describes the content of each field except 'Parameter'. SCSI-FCP defines this field as RLTV\_OFF (Relative Offset).

**Table 27: Frame header**

Byte word	3	2	1	0
0	R-CTL	D-ID		
1	Reserved	S-ID		
2	TYPE	F-CTL		
3	SEQ-ID	DF-CTL	SEQ-CNT	
4	OX-ID		RX-ID	
5	Parameter (RLTV_OFF)			

The Payload follows the header and has a length between 0 and 2048 bytes, which must be divisible by 4. An additional 0-3 fill bytes are appended to the payload in order to ensure that it ends on a word boundary.

The Cyclic Redundancy Check (CRC) is a four byte field following the payload. It is used to verify the integrity of the header and payload.

The EOF ordered set marks the end of a frame.

### 17.1.5 Sequences

A Sequence is a set of one or more related frames that flow in one direction only. The sequence is identified by the Sequence Identifier (SEQ\_ID) field in the frame header.

## 17.1.6 Exchanges

An Exchange is a set of one or more related non-concurrent sequences that may flow in the same or opposite directions. The exchange is identified by an Originator Exchange Identifier (OX\_ID) and a Responder Exchange Identifier (RX\_ID) in the frame header.

## 17.2 Basic Link Services

The Basic Link Services are all frames with no payload. The Header TYPE field is set to 00h (Basic Link Service) and R\_CTL is set to 1000xxxxb (Basic Link\_Data, Code = xxxx).

**Table 28: Basic link service command codes**

Command	Description	Abbr.
0000	No Operation	NOP
0001	Abort Sequence	ABTS
0010	Remove Connection	RMC
0100	Basic Accept	BA_ACC
0101	Basic Reject	BA_RJT
Others	Reserved	

NOP and RMC are prohibited by the Disk Profile. If the drive receives either an NOP or an RMC, it will ignore it.

**Note:** PLDA 2.1 specifies: “Reserved FC-PH fields are not required to be checked for zeroes. Validity bits set to 0 remove any requirement to check the corresponding field for zeroes (e.g., if F\_CTL bit 3=0, receiving N\_Ports are not required to verify that the parameter field in word 5 of the frame header contains zeroes).” As such, the drive does not validate 1) reserved FC fields or 2) fields that are not reserved but are not valid for the current frame (as the example above with F\_CTL bit 3). This does not apply to any reserved field checking and testing within the FCP\_CDB. These fields are checked as per ANSI SCSI requirements.

### 17.2.1 Abort sequence (ABTS)

Although ABTS is a Fibre Channel Basic Link Service, it is used by SCSI-FCP to implement the Abort Task, Task Management function. It may only be used by a SCSI initiator to abort an entire exchange using the Recovery Abort protocol. Refer to 18.4.1, “Abort Task (Implemented as ABTS BLS)” on page 111 for a description of the Recovery Abort Protocol and the frame payloads.

The response to ABTS is either BA\_ACC or BA\_RJT.

## 17.2.2 Basic accept (BA\_ACC)

BA\_ACC indicates that a Basic Link Service Request has been completed. The drive only sends a BA\_ACC in response to an ABTS Basic Link Service.

**Table 29: BA\_ACC Payload**

Byte	Item	Size (Bytes)
0	SEQ_ID Validity (80h = valid, 00h = invalid)	1
1	SEQ_ID	1
2	Reserved	2
3		
4	OX_ID	2
5		
6	RX_ID	2
7		
8	Low SEQ_CNT	2
9		
10	High SEQ_CNT	2
11		

- **SEQ\_ID Validity** specifies whether the SEQ\_ID field in the BA\_ACC payload is valid or not. The drive always sets this field to 00h.
- **SEQ\_ID** specifies the last SEQ\_ID which is deliverable to the Upper Level Protocol. Since the drive uses the ABTS protocol to abort an entire exchange, this field is unused. The drive sets this field to 00h.
- **OXID** specifies the OXID of the exchange that has been aborted by the drive.
- **RXID** specifies the RXID of the exchange that has been aborted by the drive.
- **Low SEQ\_CNT** specifies the last data frame of the last delivered sequence. Since the drive aborts the entire exchange, this field is set to 0000h.
- **High SEQ\_CNT** is only valid when an ABTS is used to abort a single sequence. Since the drive only supports aborting of entire exchanges, this field is set to 0000h.

### 17.2.3 Basic reject (BA\_RJT)

BA\_RJT indicates that a Basic Link Service Request has been rejected. The payload contains a four byte reason code to indicate why the request was rejected.

**Table 30: BA\_RJT Payload**

Byte	Item	Size (Bytes)
0	Reserved	1
1	Reason Code	1
2	Reason Explanation	1
3	Vendor Unique	1

**Table 31: BA\_RJT Reason Codes**

Code	Description
0000 0001	Invalid command code
0000 0011	Logical error
0000 0101	Logical busy
0000 0111	Protocol error
0000 1001	Unable to perform command requested
1111 1111	Vendor unique error
Others	Reserved

**Table 32: BA\_RJT Reason Code Explanations**

Code	Description
0000 0000	No additional explanation
0000 0011	Invalid OX_ID-RX_ID combination
0000 0101	Sequence aborted, no Sequence information provided
Others	Reserved

## 17.3 Extended Link Services

For Extended Link Service frames, the Header TYPE field is set to 01h (Extended Link Service). R\_CTL is either 22h (Extended Link Data, Unsolicited Control) for a Request, or 23h (Extended Link Data, Solicited Control) for a Reply.

The first byte of the payload is the LS\_Command and encodes the Request or Reply, as shown in Table 33 and Table 34.

**Table 33: Extended Link Service replies**

Code	Reply	Abbr.
02h	Accept	LS_ACC
01h	Link Service Reject	LS_RJT

Table 34 is a comprehensive list of all Extended Link Service commands supported by the drive.

**Table 34: Extended Link Service requests**

Code	Request	Abbr.
52h	Address Discovery	ADISC
60h	Fabric Address Notification	FAN
04h	Fabric Login	FLOGI
05h	Logout	LOGO
50h	Port Discovery	PDISC
03h	Port Login	PLOGI
20h	Process Login	PRLI
21h	Process Logout	PRLO
0Fh	Read Link Status	RLS
53h	Report Node Capabilities	RNC
78h	Report Node ID	RNID
12h	Re-instate Recovery Qualifier	RRQ
24h	Third Party Process Logout	TPRLO
7Dh	Report Port Speed Capabilities	RPSC
<b>Note:</b> Only lists ELSs supported by the drive. Refer to FC-PH for a complete list of ELSs.		

The code '11h' for the TEST ELS (not supported by the drive) is also used by the LIPxx frames that circulate during Loop Initialization. To differentiate these from a TEST ELS, the second byte of the payload must be examined and compared with Table 35.

**Note:** PLDA 1.10 specifies: “Reserved FC-PH fields are not required to be checked for zeroes. Validity bits set to 0 remove any requirement to check the corresponding field for zeroes (e.g., if F\_CTL bit 3=0, receiving N\_Ports are not required to verify that the parameter field in word 5 of the frame header contains zeroes).” As such, the drive does not validate 1) reserved FC fields or 2) fields that are not reserved but are not valid for the current frame (as shown in the example above with F\_CTL bit 3). This does not apply to any reserved field checking and testing within the FCP\_CDB. These fields are checked as per ANSI

SCSI requirements.

**Table 35: Extended Link Service request 11h qualifiers**

Code	Description	Abbr.
01h	Select Master	LISM
02h	Fabric Assign AL_PA	LIFA
03h	Previously Acquired AL_PA	LIPA
04h	Hard Assigned AL_PA	LIHA
05h	Soft Assigned AL_PA	LISA
06h	Report AL_PA Position Map	LIRP
07h	Loop AL_PA Position Map	LILP

If a Loop Initialization frame is received when the Port is not performing a Loop Initialization Procedure, it will be responded to by an LS\_RJT containing a reason code of “Command not supported” and a reason code explanation of “No additional explanation”. This also applies to all unsupported link services, as defined by Table 34.

### 17.3.1 Link Service Accept (LS\_ACC)

LS\_ACC is used in response to an Extended Link Service Request. It indicates that the request has been completed.

The LS\_ACC payload depends upon the Extended Link Service Request and is therefore described separately for each of the following:

- 17.3.3 “Port Login (PLOGI)”
- 17.3.4 “Logout (LOGO)”
- 17.3.5 “Fabric Login (FLOGI)”
- 17.3.6 “Fabric Address Notification (FAN)”
- 17.3.7 “Port Discovery (PDISC)”
- 17.3.8 “Address Discovery (ADISC)”
- 17.3.9 “Process Login (PRLI)”
- 17.3.10 “Process Logout (PRLO)”
- 17.3.11 “Read Link Error Status Block (RLS)”
- 17.3.12 “Report Node Capabilities (RNC)”
- 17.3.13 “Re-instate Recovery Qualifiers (RRQ)”
- 17.3.14 “Third Party Process Logout (TPRLO)”
- 17.3.15 “Request Node Identification Data (RNID)”
- 17.3.16 “Report Port Speed Capabilities (RPSC)”

### 17.3.2 Link Service Reject (LS\_RJT)

LS\_RJT indicates that the Extended Link Service request has been rejected. The payload (shown in Table 36) contains a Reason Code and a Reason Explanation.

**Table 36: LS\_RJT payload**

Byte	Item	Size (Bytes)
0 3	0100 0000h	4
4	Reserved	1
5	Reason Code (Table 37)	1
6	Reason Explanation (Table 38)	1
7	Vendor Unique	1

**Table 37: LS\_RJT reason codes**

Code	Description
01h	Invalid command code
03h	Logical error
05h	Logical busy
07h	Protocol error
09h	Unable to perform command requested
0Bh	Command not supported
FFh	Vendor unique error

**Table 38: LS\_RJT reason code explanations**

Code	Description
00h	No additional explanation
01h	Service Parm error - Options
03h	Service Parm error - Initiator Ctl
05h	Service Parm error - Recipient Ctl
07h	Service Parm error - Rec Data Field Size
09h	Service Parm error - Concurrent Seq
0Bh	Service Parm error - Credit
0Dh	Invalid Port Name
0Eh	Invalid Node/Fabric Name
0Fh	Invalid Common Service Parameters
19h	Command (request) already in progress
1Fh	Invalid N_Port identifier
29h	Insufficient resources to support Login
2Ah	Unable to supply requested data
2Ch	Request not supported

**Note:** Refer to FC-PH for a full list. Only the explanations relevant to supported Extended Link Services are shown.

### 17.3.3 Port Login (PLOGI)

PLOGI is used by the Initiator to register Service Parameters with the Target if Implicit Login is not being used (see 19.10.12, “Mode Page 19h (Fibre Channel Port Control Page)” on page 190). The Target responds with an LS\_ACC that has a payload similar to the PLOGI but which contains the Targets parameters. This exchange of parameters establishes the operating environment between the Initiator and the Target.

PLOGI can also be issued by the Target when it is operating as a Public Loop Device. In this case, the Target uses a PLOGI to establish the operating environment between it and the Fabric Name Server.

Bytes 1, 2, and 3, of the payload must be set to zeros. Otherwise, the drive will respond with an LS\_RJT containing a reason code of “Command not supported”, and a reason code explanation of 00h “No additional explanation”.

**Table 39: PLOGI\_REQ/PLOGI\_ACC payload**

<b>Byte</b>	<b>Item</b>	<b>Size (Bytes)</b>
<b>0-3</b>	Request = 0300 0000h; Accept = 0200 0000h	4
<b>4 - 19</b>	Common Service Parameters	16
<b>20 - 27</b>	Port Name	8
<b>28 - 35</b>	Node Name	8
<b>36 - 51</b>	Class 1 Service Parameters	16
<b>52 - 67</b>	Class 2 Service Parameters	16
<b>68 - 83</b>	Class 3 Service Parameters	16
<b>84 - 99</b>	Reserved	16
<b>100 - 115</b>	Vendor Version Level	16

### 17.3.3.1 Common Service Parameters

The Common Service Parameters apply to all classes of service and are exchanged during Login. The table below defines the applicability, by class as well as by PLOGI, FLOGI, PLOGI LS\_ACC and FLOGI LS\_ACC, of the Common Service Parameters to N\_Port and Fabric Login. These are words 1-4 in the Payload..

**Table 40: Common Service Parameter applicability (part 1 of 2)**

Service parameter	Word	Bits	PLOGI and PLOGI LS_ACC Parameter applicability				FLOGI Parameter applicability				FLOGI LS_ACC Parameter applicability			
			Class				Class				Class			
			1*	2	3	4	1*	2	3	4	1*	2	3	4
FC-PH Version - Obsolete	1	31-16	n	n	n	n	n	n	n	n	n	n	n	n
Buffer-to-Buffer Credit	1	15-0	y	y	y	n	y	y	y	n	y	y	y	n
Common Features	2	31-16												
Continuously increasing relative offset	2	31	y	y	y	y	n	n	n	n	n	n	n	n
Clean Address	2	31	n	n	n	n	n	n	n	n	y	y	y	y
Random relative offset	2	30	y	y	y	y	n	n	n	n	n	n	n	n
Valid Vendor Version Level	2	29	y	y	y	y	y	y	y	y	n	n	n	n
N_Port/F_Port	2	28	y	y	y	y	y	y	y	y	y	y	y	y
BB_Credit Management	2	27	y	y	y	y	y	y	y	y	n	n	n	n
E_D_TOV Resolution	2	26	y **	y **	y **	y **	n	n	n	n	y	y	y	y
Multicast supported by Fabric	2	25	n	n	n	n	n	n	n	n	y	y	y	y
Broadcast supported by Fabric	2	24	n	n	n	n	n	n	n	n	y	y	y	y
Hunt Group routing supported by Fabric	2	23	n	n	n	n	n	n	n	n	y	y	y	y
Simplex Dedicated Connection - Obsolete	2	22	n	n	n	n	n	n	n	n	n	n	n	n
Reserved for security	2	21	n	n	n	n	n	n	n	n	n	n	n	n
Clock Synchronization Primitive Capable	2	20	y	y	y	y	y	y	y	y	y	y	y	y
R_T_TOV Value	2	19	y	y	y	y	y	y	y	y	y	y	y	y
Dynamic Half Duplex Supported	2	18	y	y	y	y	y	y	y	y	y	y	y	y
SEQ_CNT	2	17	y	y	y	y	n	n	n	n	n	n	n	n
Payload bit	2	16	y	y	y	y	y	y	y	y	y	y	y	y

"y" indicates yes, applicable (i.e. has meaning)

"n" indicates no, not applicable (i.e. has no meaning)

\* The Class 1 Service Parameters shall be used for Class 6. Each has the same applicability as Class 1.

\*\* E\_D\_TOV resolution and the corresponding value are only meaningful in a point-to-point topology and when doing PLOGI with an NL\_Port on the same loop.

**Table 41: Common Service Parameter applicability (part 2 of 2)**

Service parameter	Word	Bits	PLOGI and PLOGI LS_ACC Parameter applicability				FLOGI Parameter applicability				FLOGI LS_ACC Parameter applicability			
			Class				Class				Class			
			1*	2	3	4	1*	2	3	4	1*	2	3	4
BB_SC_N	2	15-12	y	y	y	n	y	y	y	n	y	y	y	n
Buffer-to-Buffer Receive Data Field Size	2	11-0	y	y	y	y	y	y	y	y	y	y	y	y
Nx_Port Total Concurrent Sequences	3	31-16	y	y	y	y	n	n	n	n	n	n	n	n
Relative offset by Info Category	3	15-0	y	y	y	y	n	n	n	n	n	n	n	y
R_A_TOV	3	31-0	n	n	n	n	n	n	n	n	y	y	y	y
E_D_TOV Value	4	31-0	y **	y **	y **	y **	n	n	n	n	y	y	y	y

"y" indicates yes, applicable (i.e. has meaning)

"n" indicates no, not applicable (i.e. has no meaning)

\* The Class 1 Service Parameters shall be used for Class 6. Each has the same applicability as Class 1.

\*\* E\_D\_TOV resolution and the corresponding value are only meaningful in a point-to-point topology and when doing PLOGI with an NL\_Port on the same loop.

The upper byte of the FC-PH Version field indicates the highest version of FC-PH that is supported and the lower byte indicates the lowest. The code/version relationship is shown in Table 42.

**Table 42: FC-PH Version**

Hex value	Version
00	None
06	FC-PH 4.0
07	FC-PH 4.1
08	FC-PH 4.2
09	FC-PH 4.3
10h	FC-PH-2
20h	FC-PH-3
Others	Reserved

The **BB\_Credit** field indicates the number of frame buffers that a port guarantees to have immediately available when a loop circuit is opened. The drive returns 0 (zero) in this field; i.e., every Initiator is given a Login BB\_Credit of 0.

The **Common Features** field contains flags.

- **CIO - Continuously Increasing Offset**

When set to one, this flag indicates that the Port supports Continuously Increasing Relative Offset within a Sequence on a frame by frame SEQ\_CNT basis. The Relative Offset is only present if bit 3 of the F\_CTL field in the frame header is set to 1b. The drive requires that an initiator support Continuously Increasing Relative Offset. If this field is

not one, the drive will respond with an LS\_RJT containing a reason code of 03h “Logical error”, and a reason code explanation of 0Fh “Invalid Common Service Parameters”. The drive returns a 1b in this field.

- **RRO - Random Relative Offset**

When set to one, this flag indicates that the Port supports Random Relative Offset within a Sequence. The Relative Offset is only present if bit 3 of the F\_CTL field in the frame header is set to 1b. The drive returns a 0b in this field.

- **VV - Valid Vendor Version Level**

When set to one, this flag indicates that the Vendor Version Level field in the frame payload contains valid information. The drive returns a 0b in this field.

- **N/F Port - N\_Port/F\_Port**

When set to one, this flag indicates that the Port is an F\_Port. When set to zero, it is an N\_Port. The drive returns a 0b in this field.

- **ABCM - Alternate BB-Credit Model**

When set to one, this flag indicates that the Port supports the Alternate BB-Credit model. The drive returns a 1b in this field.

- **E\_D\_TOV - E\_D\_TOV Resolution**

When set to one, this flag indicates that the resolution of the E\_D\_TOV timer shall be 1 ns. When set to zero, the resolution shall be 1 ms. The flag is only applicable in a point to point topology. The drive returns a 0b in this field.

- **DS - Dedicated Simplex**

Only applies to class 1 service. The drive sets this field to 0b.

- **DHD - Dynamic Half Duplex**

When set to one, this flag indicates that the Port supports Dynamic Half Duplex. The drive returns a 0b in this field.

- **SEQ\_CNT - SEQ\_CNT**

When set to one, this flag indicates that the Port is guaranteeing that it will transmit all frames within an Exchange using a continuously increasing SEQ\_CNT. If set to zero, normal FC\_PH rules regarding SEQ\_CNT usage apply. The drive returns a 0b in this field.

- **PL - Payload Length**

When set to one, this flag indicates that PLOGI Payload Length shall be 256 bytes. If set to zero, the flag specifies that the normal 116 byte PLOGI Payload specified in FC-PH-2 is used. The drive returns a 0b in this field.

The **Buffer-to-Buffer Receive Data\_Field Size** field (word 2, bits 11-0) specifies the largest FT\_1 frame Data\_Field Size that may be received by the Nx\_Port supplying the Service Parameters as a Sequence Recipient for:

- a) a connect-request (SOFc1),
- b) a Class 2 Data frame, or
- c) a Class 3 Data frame

Values less than **256** or greater than  $2^{112}$  are invalid and shall be a multiple of four bytes. An Fx\_Port shall support a Data Field size of at least 256 bytes.

The **Total Concurrent Sequences** field indicates the number of concurrent sequences that the Port can support for all 3 classes. The value sent must be  $> 0$ , or the drive will respond with an LS\_RJT with a reason code of 03h “Logical error” and a reason code explanation of 09h “Service Parm error - Concurrent Seq”. The drive returns a value of FFh in this field.

The **Relative Offset by Information Category** field is all flags. The bit position of each set (1) bit determines the Information Category; e.g., if Relative Offset is supported for category 0001b (Solicited Data), bit 1 is set. The drive returns a value of 0002h in this field (Relative Offset supported for Solicited Data only).

The **E\_D\_TOV** field specifies the E\_D\_TOV (Error Detect Timeout Value) in units of 1ns or 1ms. If the E\_D\_TOV Resolution bit is set to one, this field specifies E\_D\_TOV as a count of 1ns increments, otherwise it specifies E\_D\_TOV as a count of 1ms increments. It is only applicable in a point to point topology. The drive returns zero in this field. It is not interpreted or checked.

### 17.3.3.2 Class Service Parameters

Since the drive only supports Class 3 service, it only checks and responds to the Class 3 Service Parameters.

**Table 43: Class Service Parameters**

Byte	BIT								Default ACC Values
	7	6	5	4	3	2	1	0	
68	CV	IM	TM	LDM	SD	DS	Camp-On	BufC1	80h
69	Priority	Reserved							00h
<b>Initiator Control Flags (Bytes 70-71)</b>									
70	X_ID Reassign		IP Associator		ACK_0	ACK_N	ACK Gen	DCC	00h
71	DCHBS		DEC	CSC	Reserved				00h
<b>Recipient Control Flags (Bytes 72-73)</b>									
72	ACK_0 Cap	ACK_N Cap	X_ID Int.	EP Supported		Reserved	Categ. Per Sequence		00h
73	DCC	DCHBS		DDC	CSS	Reserved			00h
74	(MSB) Receive Data-Field Size								08h
75									(LSB) 00h
76	(MSB) Concurrent Sequences								00h
77									(LSB) FFh
78	(MSB) End-to-End Credit								00h
79									(LSB) 00h
80	(MSB) Open Sequences per Exchange								00h
81									(LSB) 01h
82	(MSB) Class 6 Multi-cast RX_ID								00h
83									(LSB) 00h

The **Service Options** field contains the following flags.

- **CV - Class Validity**

When set to one, this flag indicates that the class of service is supported. The drive only supports Class 3, thus this bit is only set for the Class 3 Service Parameters. If this bit is not set for Class 3 Service Parameters, the drive will respond with an LS\_RJT containing a reason code of 03h “Logical error” and a reason code explanation of 01h “Service Parm error - Options”.

- **IM - Intermix Mode**

The flag only applies to class 1 service and is reserved for classes 2 and 3. The drive returns 0b in this field.

- **TM - Transparent Mode**

The flag does not apply to PLOGI. The drive returns 0b in this field.

- **LDM - Lock Down Mode**

This flag does not apply to PLOGI. The drive returns 0b in this field.

- **SD - Sequential Delivery**

This flag does not apply to PLOGI. The drive returns 0b in this field.

- **DS - Dedicated Simplex**

This flag only applies to class 1 service. The drive returns 0b in this field.

- **Camp-On - Camp-On**

This flag only applies to class 1 service. The drive returns 0b in this field.

- **BufC1 - Buffered Class 1**

This flag only applies to class 1 service. The drive returns 0b in this field.

- **Priority**

This flag does not apply to class 3 service. The drive returns 0b in this field.

The **Initiator Control** flags specify which protocols, policies, or functions the supplier of the Service Parameters requests of the recipient or is capable of.

- **X\_ID Reassign - X\_ID Reassignment**

- 0 0** X\_ID Reassignment not supported.
- 0 1** X\_ID Reassignment supported.
- 1 0** Reserved.
- 1 1** X\_ID Reassignment required.

The X\_ID Reassignment bits only apply to class 1 or 2 and therefore are not checked by the drive.

- **IP Associator - Initial Process Associator**

- 0 0** Initial Process Associator not supported.
- 0 1** Initial Process Associator supported.
- 1 0** Reserved.
- 1 1** Initial Process Associator required.

The drive accepts values of “00” and “01” in this field. If other values are sent, the drive responds with an LS\_RJT containing a reason code of 03h “Logical error” and a reason code explanation of 03h “Service Parm error - Initiator Ctl”. The drive returns 00b in this field.

- **ACK\_0 - ACK\_0 Capability**

This flag does not apply to class 3 and therefore is not checked by the drive. The drive returns 0b in this field.

- **ACK\_N - ACK\_N Capability**

This flag does not apply to class 3 and therefore is not checked by the drive. The drive returns 0b in this field.

- **ACK Gen - ACK generation assistance**

This flag does not apply to class 3 and therefore is not checked by the drive. The drive returns 0b in this field.

- **DCC - Data compression capable**

When set to one, this flag indicates the Port supports data compression as a Sequence Initiator. The drive does not support data compression, therefore the drive returns 0b in this field.

- **DCHBS - Data compression History buffer size**

This field indicates the History buffer size supported by the Port as a Sequence Initiator. The drive does not support data compression, therefore, the drive returns 00b in this field.

- **DEC - Data encryption capable**

When set to one, this flag indicates the Port supports data encryption as a Sequence Initiator. The drive does not support data compression, therefore the drive returns 0b in this field.

- **CSC - Clock synchronization capable**

When set to one, this flag indicates the Port is capable of performing clock synchronization as a Sequence Initiator (Clock Synchronization Server). The drive is not capable of performing clock synchronization, therefore the drive returns 0b in this field.

The **Recipient Control** flags specify which functions the supplier of the Service Parameters supports when receiving frames.

- **ACK\_0 Cap - ACK\_0 Capability**

This flag only applies to class 1 or 2, therefore is not checked by the drive. The drive returns 0b in this field.

- **ACK\_N Cap - ACK\_N Capability**

This flag only applies to class 1 or 2, therefore is not checked by the drive. The drive returns 0b in this field.

- **X\_ID Int. - X\_ID Interlock**

This flag only applies to class 1 or 2, therefore is not checked by the drive. The drive returns 0b in this field.

- **EPS - Error Policy Supported**

<b>0 0</b>	Only discard supported
<b>0 1</b>	Reserved
<b>1 0</b>	Both discard and process supported
<b>1 1</b>	Reserved

The Error Policy bits are not checked by the drive. The drive returns 00b in this field.

- **Categ. per Sequence - Categories per Sequence**

<b>0 0</b>	1 Category/Sequence
<b>0 1</b>	2 Categories/Sequence
<b>1 0</b>	Reserved
<b>1 1</b>	More than 2 Categories/Sequence. The drive returns 00b in this field.

The **Receive Data Field** size is the largest payload (in bytes) that the Port is capable of receiving. It must be less than or equal to the Buffer to Buffer Receive Data Field specified in the Common Service Parameters. Sizes less than 128, greater than 2112, or not divisible by 4 are invalid, in which case the drive will respond with an LS\_RJT containing a reason code of 03h “Logical error” and a reason code explanation of 07h “Service Parm error - Rec Data Field Size”. The drive returns 2048 in this field.

The **Concurrent Sequences** field specifies the number of separate Sequences that the drive is capable of tracking. The value sent must be > 0, or the drive will respond with an LS\_RJT containing a reason code of 03h “Logical error” and a reason code explanation of 09h “Service Parm error - Concurrent Seq”. The drive returns a value of 255 in this field.

The **End-to-end Credit** field applies only to classes 1 and 2 and is therefore not checked by the drive. The drive returns 0 in this field.

The **Open Sequences per Exchange** field indicates the maximum number of Sequences per Exchange that can be open at the recipient at one time. The value sent must be > 0, or the drive will respond with an LS\_RJT containing reason code of 03h “Logical error” and a reason code explanation of 00h “No additional explanation”. The drive returns 01b in this field.

The **Class 6 Multicast RXID** is used in Class 6 only and is therefore not checked by the drive. The drive returns 00b in this field.

### 17.3.4 Logout (LOGO)

LOGO is used by an Initiator to request invalidation of the Service Parameters that were exchanged during PLOGI. If implicit login is enabled by the settings in Mode Page 19, then the default Service Parameters apply. If no valid Service Parameters exist for an Initiator, a LOGO\_ACC is still returned.

Bytes 1, 2, and 3 of the payload must be set to zero. Otherwise, the drive will respond with an LS\_RJT containing a reason code of 0Bh “Command not supported” and a reason code explanation of 00h “No additional explanation”.

**Table 44: LOGO payload**

Byte	Item	Size (Bytes)
0-3	0500 0000h	4
4	Reserved	1
5-7	Port Identifier	3
8 - 15	Port Name	8

**Table 45: LOGO ACC payload**

Byte	Item	Size (Bytes)
0-3	0200 0000h	4

### 17.3.5 Fabric Login (FLOGI)

FLOGI is used by the drive to register its Service Parameters with the Fabric assuming the drive exists on a Public Loop (i.e. the loop contains an FL\_Port). Once the drive has completed FLOGI, it is then permitted to use the local FL\_Port as a gateway, allowing it to communicate with other N\_Ports and NL\_Ports attached to the fabric. (See 21.5, “Public Loop Operation” on page 312.)

The drive performs a FLOGI by opening a full duplex connection to FL\_Port located at AL\_PA 00h and sending a FLOGI request to the well-known address of FFFFFFFh. The FL-Port responds to a valid request with a FLOGI Accept frame that contains the FL\_Port’s operating parameters. The D-ID field of the FLOGI Accept frame contains the fabric assigned Domain, Area, and the AL-PA of the drive performing the FLOGI. The drive uses this address in all further communication with other N\_Ports and Public NL\_Ports. The drive will not perform a FLOGI if the drive fails to detect an FL\_Port during Loop-Initialization.

**Table 46: FLOGI\_REQ/FLOGI\_ACC payload**

Byte	Item	Size (Bytes)
0-3	Request = 0400 0000h; Accept = 0200 0000h	4
4 - 19	Common Service Parameters	16
20 - 27	Port Name	8
28 - 35	Node Name	8
36 - 51	Class 1 Service Parameters	16
52 - 67	Class 2 Service Parameters	16
68 - 83	Class 3 Service Parameters	16
84 - 99	Reserved	16
100 - 115	Vendor Version Level	16

### 17.3.5.1 Common Service Parameters

The Common Service Parameters apply to all classes of service and are exchanged during Login.

**Table 47: Common Service Parameters (FLOGI\_REQ/FLOGI\_ACC)**

Byte	BIT								Default Request Values
	7	6	5	4	3	2	1	0	
4	PH Version - Highest Supported								20h
5	PH Version - Lowest Supported								20h
6	(MSB) Buffer-to-Buffer Credit (LSB)								00h
7									00h
8	Reserved	VV	N/F Port	ABCM	Reserved			00h	
9	Reserved				DHD	Reserved	PL	00h	
10	(MSB) BB Received Data Field Size (LSB)								08h
11									00h
12	(MSB) FLOGI_REQ = Reserved; FLOGI_ACC = R_A_TOV (LSB)								00h
13									00h
14									00h
15									00h
16	(MSB) FLOGI_REQ = Reserved; FLOGI_ACC = E_D_TOV (LSB)								00h
17									00h
18									00h
19									00h

The upper byte of the **FC-PH Version** field indicates the highest version of FC-PH that is supported and the lower byte indicates the lowest. The code/version relationship is given by Table 42.

The **BB\_Credit** field indicates the number of frame buffers that a port guarantees to have immediately available when a loop circuit is opened. The drive sets this field to 0 (zero); i.e., the drive grants the FL\_Port a Login BB\_Credit of 0.

The **Common Features** field contains the following flags:

- **VV- Valid Vendor Version Level**

When set to one, this flag indicates that the Vendor Version Level field in the frame payload contains valid information. The drive sets this field to 0b.

- **N/F Port - N\_Port/F\_Port**

When set to one, this flag indicates that the Port is an F\_Port. When set to zero, it is an N\_Port. The drive checks this field in the FLOGI\_ACC and will revert to PLDA behavior if it is not set to one. The drive sets this field to 0b.

- **ABCM - Alternate BB-Credit model**

When set to one, this flag indicates that the Port supports the Alternate BB-Credit model. As per the FC-AL Specification, an L\_Port and must support the Alternate BB-Credit model. The drive checks the value returned by the FL\_Port and will revert to PLDA behavior if it is not set to one. The drive sets this field to 1b.

- **DHD - Dynamic Half Duplex**

When set to one, this flag indicates that the Port supports the Dynamic Half Duplex. The drive sets this field to 0b.

- **PL - Payload Length**

When set to one, this flag indicates that FLOGI Payload Length shall be 256 bytes. If set to zero, the flag specifies that the normal 116 byte FLOGI payload specified in FC-PH-2. The drive sets this field to 0b.

The **Buffer to Buffer Receive Data Field** size indicates the largest frame payload (in bytes) that the Port can receive. Sizes less than 128, greater than 2112, or not divisible by 4 are invalid. The drive check this field in the FLOGI\_ACC payload and will revert to PLDA behavior if an invalid value is returned. The drive sets this field to 2048.

The **R\_A\_TOV** field specifies the R\_A\_TOV (Resource Allocation Timeout Value) supplied by the fabric in units of 1ms. The fabric port sets this field in its FLOGI\_ACC payload. This field is reserved in the FLOGI\_REQ and the drive therefore sets this field to zero. After FLOGI is complete, the drive will use this value for R\_A\_TOV until the drive is reset, reverts to PLDA behavior, or performs another FLOGI.

The **E\_D\_TOV** field specifies the E\_D\_TOV (Error Detect Timeout Value) supplied by the fabric in units of 1ns or 1ms. The fabric port sets this field in its FLOGI\_ACC payload. This field is reserved in the FLOGI\_REQ and the drive therefore sets this field to zero. After FLOGI is complete, the drive will use this value for E\_D\_TOV until the drive is reset, reverts to PLDA behavior, or performs another FLOGI.

### 17.3.5.2 Class Service Parameters

Since the drive only supports class 3 service, it only checks and responds to the class 3 Service Parameters.

**Table 48: Class Service Parameters**

Byte	BIT								Default Request Values
	7	6	5	4	3	2	1	0	
68	CV	IM	TM	LDM	SD	DS	Camp-On	BufC1	80h
69	Priority	Reserved							00h
<b>Initiator Control Flags (Bytes 70-71)</b>									
70	Reserved								00h
71	Reserved								00h
<b>Recipient Control Flags (Bytes 72-73)</b>									
72	Reserved								00h
73	Reserved								00h
74	Receive Data-Field Size (Reserved)								00h
75									(LSB)
76	Concurrent Sequences (Reserved)								00h
77									(LSB)
78	End-to-End Credit (Reserved)								00h
79									(LSB)
80	Open Sequences per Exchange (Reserved)								00h
81									(LSB)
82	Class 6 Multi-cast RXID (Reserved)								00h
83									(LSB)

The **Service Options** field contains the following flags:

- **CV - Class Validity**

When set to one, this flag indicates that the class of service is supported. The drive only supports class 3 thus this bit is only set for the class 3 Service Parameters. If the FLOGI\_ACC indicates that the fabric does not support class 3, the drive will revert to PLDA behavior.

- **IM - Intermix Mode**

This flag only applies to class 1 service. It is reserved for classes 2 and 3. The drive sets this field to 0b.

- **TM - Transparent Mode**

This flag only applies to class 1 service. It is reserved for classes 2 and 3. The drive sets this field to 0b.

- **LDM - Lock Down Mode**

This flag only applies to class 1 service. It is reserved for classes 2 and 3. The drive sets this field to 0b.

- **SD - Sequential Delivery**

The drive sets this field to 1b to request that the fabric deliver all frames in the same order they were transmitted. The fabric sets this flag to 1b if it can honor this request. Since the drive does not support out of order frame delivery, the drive checks the FLOGI\_ACC to ensure that this field is set to 1b and will revert to PLDA behavior if it is not.

- **DS - Dedicated Simplex**

This flag only applies to class 1 service. The drive sets this field to 0b.

- **Camp On - Camp-On**

This flag only applies to class 1 service. The drive sets this field to 0b.

- **BufC1 - Buffered Class 1**

This flag only applies to class 1 service. The drive sets this field to 0b.

- **Priority - Priority**

This flag does not apply to class 3 service. The drive sets this field to 0b.

The **Initiator Control Flags** are not meaningful for FLOGI and are therefore reserved. The drive sets this field to 00h.

The **Recipient Control Flags** are not meaningful for FLOGI and are therefore reserved. The drive sets this field to 00h.

The **Receive Data Field Size** field is not meaningful for FLOGI and is therefore reserved. The drive sets this field to 00h.

The **Concurrent Sequences** field is not meaningful for FLOGI and is therefore reserved. The drive sets this field to 00h.

The **End-to-End Credit** field is not meaningful for FLOGI and is therefore reserved. The drive sets this field to 00h.

The **Open Sequences per Exchange** field is not meaningful for FLOGI and is therefore reserved. The drive sets this field to 00h.

The **Class 6 Multi-cast RXID** field is not meaningful for FLOGI and is therefore reserved. The drive sets this field to 00h.

### 17.3.6 Fabric Address Notification (FAN)

The FAN ELS is sent by an FL\_Port to all previously logged in (FLOGI) NL\_Ports after an initialization event has occurred. An initialization event can be a LIP or any other event that may cause a Port to change its ID. The FAN ELS is used by attached NL\_Ports to validate their operating parameters with the local FL\_Port after an initialization event has occurred. The drive does not return a response to this ELS.

(Note: When operating as a private loop device, the drive will discard the FAN ELS request.)

**Table 49: FAN payload**

Byte	Item	Size (Bytes)
0-3	Command Code = 60000000h	4
4	reserved	1
5-7	Loop Fabric Address	3
8 -15	Fabric Port Name	8
16 -23	Fabric Name	8

The **Command Code** must be equal to 60000000h or the drive will ignore the request.

The **Loop Fabric Address** is the 3 byte Port\_ID of the local FL\_Port.

The **Fabric Port Name** is the world-wide-unique 8-byte Port\_Name of the local FL\_Port.

The **Fabric Name** is the world-wide-unique 8-byte name of the Fabric.

### 17.3.7 Port Discovery (PDISC)

An Initiator uses PDISC to exchange service parameters without affecting the operating environment between it and the drive. The PDISC and corresponding ACC payloads are exactly as defined for PLOGI (see 17.3.3, “Port Login (PLOGI)” on page 63), except that byte 0 of the payload is 50h. It can be used as a means of authentication following a Loop Initialization process. If AL\_PA's of the Initiator and Target have not changed since the previous login, the Initiator and Target can continue where they left off prior to the LIP and all open exchanges will continue. If the current AL\_PA's do not match the login values, the drive will implicitly log out the Initiator.

If some means of authentication following a LIP does not occur within RR\_TOV, the drive will implicitly log out the Initiator.

Bytes 1, 2, and 3 of the payload must be set to zero. Otherwise, the drive will respond with an LS\_RJT containing a reason code of 0Bh “Command not supported” and a reason code explanation of 00h “No additional explanation”.

### 17.3.8 Address Discovery (ADISC)

The ADISC ELS allows communicating N-Ports to exchange addresses and port/node name identifiers. It can be used as a quick means of authentication following a Loop Initialization process. If the AL\_PA's of the Initiator and Target have not changed since the previous login, the Initiator and Target can continue where they left off prior to the LIP, and all open exchanges will continue. If the current AL\_PA's do not match the login values, the drive will implicitly log out the Initiator. ADISC can also be used as a means to determine if a port was able to acquire its hard AL\_PA during LIP.

Bytes 1, 2, and 3 of the payload must be set to zero. Otherwise, the drive will respond with an LS\_RJT containing a reason code of 0Bh “Command not supported” and a reason code explanation of 00h “No additional explanation”.

If some means of authentication following a LIP does not occur within RR\_TOV, the drive will implicitly log out the Initiator.

The following tables show the ADISC payload and the ADISC ACC payload.

**Table 50: ADISC payload**

Byte	Item	Size (Bytes)
0-3	Command Code = 52000000h	4
4	Reserved	1
5 -7	Hard Address of Originator	3
8 -15	Port Name of Originator	8
16 -23	Node Name of Originator	8
24	Reserved	1
25-27	N_Port ID of Originator	3

**Table 51: ADISC ACC payload**

Byte	Item	Size (Bytes)
0-3	ACC Code = 02000000h	4
4	Reserved	1
5-7	Hard Address of Responder	3
8 -15	Port Name of Responder	8
16 -23	Node Name of Responder	8
24	Reserved	1
25-27	N_Port ID of Responder	3

**Hard Address:** This 3 byte identifier consists of:

- The MSB is an 8-bit domain address. If the drive is acting as a Public Loop Device, it returns the domain address given to it by the Fabric port during login. Otherwise the drive returns 0s in this field.
- The middle byte is an 8-bit area address. If the drive is acting as a Public Loop Device, it returns the area address given to it by the Fabric port during login. Otherwise the drive returns 0s in this field.
- The LSB is the 8-bit AL\_PA that the port attempts to acquire during the LIHA sequence of LIP. For the drive, this number is calculated from the SEL-ID pins on the SCA-2 backplane connector.

When the Hard Address field is equal to the N\_Port ID field, the port was able to obtain its hard address during LIP. The drive does not check the value sent from the originator.

**Port Name:** IEEE unique address assigned during the manufacturing process.

**Node Name:** IEEE unique address assigned during the manufacturing process.

**N\_Port ID:** This is the 24-bit NL\_Port Identifier used in the S\_ID of the ADISC Accept header. The lower 8 bits are the AL\_PA the drive acquired during loop initialization, and the upper 16 bits are the domain and area addresses the drive obtained from the Fabric port. For private devices the upper two bytes should be all 0s. When this field matches the Hard Address field, the drive was able to acquire its hard AL\_PA during LIP.

### 17.3.9 Process Login (PRLI)

The PRLI request informs the recipient of the capabilities and requirements of the originator. The recipient responds with an ACC to indicate agreement or LS\_RJT otherwise.

**Table 52: PRLI payload**

Byte	Item	Size (Bytes)
0	20h	1
1	Page Length = 10h	1
2-3	Payload Length	2
4-max	Login service parameter pages	n*16

**Table 53: PRLI ACC payload**

Byte	Item	Size (Bytes)
0	02h	1
1	Page Length=10h	1
2-3	Payload Length	2
4-max	Login response service parameter pages	n*16

### 17.3.9.1 Process Login Service Parameter page

**Table 54: Login Service Parameter page**

Byte	Item	Size (Bytes)
0	TYPE Code = 08h	1
1	TYPE Code Extension = 00h	1
2-3	Flags	2
4-7	Originator Process Associator	4
8-11	Responder Process Associator	4
12-15	Service Parameters	4

The **TYPE code** field for SCSI-FCP is 08h, and the **TYPE Code Extension** field is 00h.

The **Flags** field is as follows:

- **Bit 15 - Originator Process Associator Valid**

When set to one, the Originator Process Associator field for this Service Parameter page is valid.

- **Bit 14 - Responder Process Associator Valid**

When set to one, the Responder Process Associator field for this Service Parameter page is valid.

- **Bit 13 - Establish Image Pair**

When set to one, this flag indicates that the Originator wishes to establish an image pair.

- **Bits 12-0 - Reserved**

The **Originator Process Associator** identifies a group of related processes (an 'image') within the originator.

The **Responder Process Associator** identifies a group of related processes (an 'image') within the responder.

The **Service Parameters** field contains flags, as follows:

- **Bits 31-7 - Reserved**

- **Bit 6 - Data Overlay Allowed**

When set to one, this flag indicates that the initiator function is capable of supporting data overlay.

- **Bit 5 - Initiator Function**

When set to one, this flag indicates that the process defined by this page is operating as a SCSI Initiator.

This bit must be set to one in order for the drive to accept the login request. If not, the drive will respond with an LS\_RJT containing a reason code of 03h “Logical error” and a reason code explanation of 00h “No additional explanation”.

- **Bit 4 - Target Function**

When set to one, this flag indicates that the process defined by this page is operating as a SCSI Target.

- **Bit 3 - Command/Data Mixed Allowed**

When set to one, this flag indicates that FCP\_CMND and FCP\_DATA may be combined in one IU.

- **Bit 2 - Data/Response Mixed Allowed**

When set to one, this flag indicates that FCP\_DATA and FCP\_RSP may be combined in one IU.

- **Bit 1 - Read XFER\_RDY Disabled**

When set to one, this flag indicates that the FCP\_XFER\_RDY IU may not be used for SCSI READ operations.

- **Bit 0 - Write XFER\_RDY Disabled**

When set to one, this flag indicates that the FCP\_XFER\_RDY IU may not be used for SCSI WRITE operations.

### 17.3.9.2 Process Login Response Service Parameter page

Table 55: Login Response Service Parameter page

Byte	Item	Size (Bytes)	Drive Response
0	TYPE Code	1	08h
1	TYPE Code Extension	1	00h
2-3	Flags	2	21 00h
4-7	Originator Process Associator	4	00 00 00 00h
8-11	Responder Process Associator	4	00 00 00 00h
12-15	Service Parameters	4	00 00 00 12h

The **TYPE Code** field for SCSI-FCP is 08h, and the **TYPE Code Extension** field is 00h.

The **Flags** field is as follows:

- **Bit 15 - Originator Process Associator Valid**

Since the drive does not support Process Associators, this bit must be set to zero in the payload. If not, the drive will respond with a PRLI ACC response code of 07h. The drive returns 0b in this field.

- **Bit 14 - Responder Process Associator Valid**

Since the drive does not support Process Associators, this bit must be set to zero in the payload. If not, the drive will respond with a PRLI ACC response code of 04h. The drive returns 0b in this field.

- **Bit 13 - Image Pair Established**

The drive returns a 1b in this field.

- **Bit 12 - Reserved**

- **Bits 11-8 - Accept Response Code**

See Table 56.

- **Bits 7-0 - Reserved**

The **Originator Process Associator** and **Responder Process Associator** fields are not used and will be set to 00000000h by the drive.

The **Service Parameters** field contains flags, as follows:

- **Bits 31-6 - Reserved**

- **Bit 5 - Initiator Function**

The drive returns 0b in this field.

- **Bit 4 - Target Function**

The drive returns 1b in this field.

- **Bit 3 - Command/Data Mixed Allowed**

The drive returns 0b in this field.

- **Bit 2 - Data/Response Mixed Allowed**

The drive returns 0b in this field.

- **Bit 1 - Read XFER\_RDY Disabled**

The drive returns 1b in this field.

- **Bit 0 - Write XFER\_RDY Disabled**

The drive returns 0b in this field.

**Table 56: PRLI/PRLO ACC response codes**

Code	Description
00h	Reserved.
01h	Request executed.
02h	The target image has no resources available for establishing image pairs between the specified source and destination N_Ports. The PRLI request may be retried.
03h	Initialization is not complete for the target image. The PRLI request may be retried.
04h	The target image corresponding to the responder PA specified in the PRLI request and PRLI accept does not exist. The PRLI request shall not be retried.
05h	The target image has a predefined configuration that precludes establishing this image pair. The PRLI request shall not be retried.
06h	Request executed conditionally. Some service parameters were not able to be set to their requested state. See the service parameters response field for further details.
07h	The destination N_Port is unable to process multiple page PRLI requests. The PRLI request may be retried as a single page request.
08h-FFh	Reserved.

### 17.3.10 Process Logout (PRLO)

The PRLO request indicates to the responder that those process image pairs specified in the service parameter pages are being discontinued by the originator. All tasks, reservations, mode page parameters and status for the specified image pairs are set to the state they would have after a SCSI hard reset or power-on reset.

**Table 57: PRLO payload**

Byte	Item	Size (Bytes)
0	21h	1
1	Page Length=10h	1
2-3	Payload Length	2
4-max	Logout service parameter pages	n*16

**Table 58: PRLO ACC payload**

Byte	Item	Size (Bytes)
0	02h	1
1	Page Length=10h	1
2-3	Payload Length	2
4-max	Logout service parameter response pages	n*16

### 17.3.10.1 Process Logout Service Parameter page

**Table 59: Logout Service Parameter page**

Byte	Item	Size (Bytes)
0	TYPE Code = 08h	1
1	TYPE Code Extension = 00h	1
2-3	Flags	2
4-7	Originator Process Associator	4
8-11	Responder Process Associator	4
12-15	Reserved	4

The **TYPE Code** field for SCSI-FCP is 08h, and the **TYPE Code Extension** field is 00h.

The **Flags** field is as follows:

- **Bit 15 - Originator Process Associator Valid**

When set to one, the Originator Process Associator field of this Service Parameter page is valid.

- **Bit 14 - Responder Process Associator Valid**

When set to one, the Responder Process Associator field of this Service Parameter page is valid.

- **Bits 13-0 - Reserved**

The **Originator Process Associator** identifies a group of related processes (an 'image') within the originator.

The **Responder Process Associator** identifies a group of related processes (an 'image') within the responder.

### 17.3.10.2 Process Logout Response Service Parameter page

**Table 60: Logout Response Service Parameter page**

Byte	Item	Size (Bytes)	Drive Response
<b>0</b>	TYPE Code	1	08h
<b>1</b>	TYPE Code Extension	1	00h
<b>2-3</b>	Flags	2	0X 00h
<b>4-7</b>	Originator Process Associator	4	00 00 00 00h
<b>8-11</b>	Responder Process Associator	4	00 00 00 00h
<b>12-15</b>	Reserved	4	00 00 00 00h

The **TYPE Code** field for SCSI-FCP is 08h, and the **TYPE Code Extension** field is 00h.

The **Flags** field is as follows:

- **Bit 15 - Originator Process Associator Valid**

The drive returns 0b in this field.

- **Bit 14 - Responder Process Associator Valid**

The drive returns 0b in this field.

- **Bits 13-12 - Reserved**

- **Bits 11-8 - Accept Response Code**

See Table 56.

- **Bits 7-0 - Reserved**

The **Originator Process Associator** and **Responder Process Associator** fields are not used.

### 17.3.11 Read Link Error Status Block (RLS)

RLS requests the recipient to return the Link Error Status Block associated with the Port Identifier specified in the payload. The drive implements a Link Error Status Block for each port. When a counter overflows, it wraps back to zero. The only way to reset the Link Error Status Block is to power off the drive.

Bytes 1, 2, and 3 of the payload must be set to zero. Otherwise, the drive will respond with an LS\_RJT with a reason code of “Command not supported” and a reason code explanation of “No additional explanation”.

Valid Port Identifiers are:

- 0** Return the Link Error Status Block for the same port on which the request was received.
- 1** Return the Link Error Status Block for Port A.
- 2** Return the Link Error Status Block for Port B.

**Table 61: RLS payload**

Byte	Item	Size (Bytes)
0-3	0F00 0000h	4
4	Reserved	1
5-7	Port Identifier	3

**Table 62: RLS ACC payload**

Byte	Item	Size (Bytes)
0-3	0200 0000h	4
4	Link Error Status Block	24
-		
27		

**Table 63: Link Error Status block**

Byte	Item	Size (Bytes)
0-3	Link Failure Count	4
4-7	Loss of sync count	4
8-11	Loss of signal count	4
12-15	Primitive Sequence Protocol error	4
16-19	Invalid Transmission Word	4
20-23	Invalid CRC Count	4

The Drive's Link Error Status block is defined as follows:

**Link Failure Count:** This is a count of the number of times that the port's receiver loses synchronization for a continuous period of time determined by R\_T\_TOV. When a link failure condition is detected by the drive, it will transmit LIP(F8) on that port.

**Loss of sync count:** This is a count of the number of times that the port's receiver loses synchronization.

**Loss of signal count:** Not implemented.

**Primitive Sequence Protocol error:** Not implemented.

**Invalid Transmission Word:** This is a count of the number of times that the port detects an invalid transmission word on its receiver.

**Invalid CRC Count:** This is a count of the number of frames received with invalid CRC. Only one invalid CRC is counted for each command nexus.

### 17.3.12 Report Node Capabilities (RNC)

The Report Node Capabilities (RNC) ELS is used to exchange node capabilities, vendor identification, and other vendor unique information. It is used to discover which document identifiers (along with their associated FC-4 protocols and profiles)

a node supports. RNC can also be used to specify which document(s) define the operating parameters between two nodes, as well as specify any additional parameters not specified during N\_Port Login.

**Table 64: RNC/ACC payload**

Byte	Item	Size (Bytes)
0	53h for RNC, 02 for ACC	4
1	Reserved	1
2-3	Payload Length	2
4	RNC Flags	1
5-6	Reserved	2
7	VU Information Length (VU_Len)	1
8 -15	Vendor Identifier	8
16->	Capability Entry(s)	m
16+m->	Vendor Unique Information	0-128

**Payload Length** is a two byte unsigned integer that specifies the length of the RNC payload. The minimum length of the RNC payload is 16 bytes, and its maximum length is limited to 256 bytes. While the maximum length of the ACC payload is not defined, the drive limits its RNC\_ACC to 256 bytes.

**RNC Flags** is a one byte field that defines options that are applicable to all Capability Entries contained in the RNC payload. The RNC Flags field is as follows:

- **Bit 7 - Select**

When this flag is set to one, the RNC\_ACC payload shall contain only one Capability Entry. This Capability Entry is selected from the list of Capability Entries specified in the RNC payload. When this flag is set to zero, the RNC\_ACC payload shall contain all of the Capability Entries that a node wishes to report.

The drive does not support the Select Flag and this field must be set to zero. Otherwise, the drive will respond with an LS\_RJT containing a reason code of 03h “Logical error” and a reason code explanation of 2Ah “No additional explanation”.

- **Bits 6-0 - Reserved**

The **VU Information Length (VU\_Len)** field is a one byte unsigned integer, which specifies the length of the Vendor Unique Information field. A maximum length of 128 bytes is supported.

The **Vendor Identifier** contains eight bytes of ASCII data, which identifies the vendor of the product.

**Vendor Unique Information** is defined by vendor or profile specific documentation.

### 17.3.12.1 Capability Entry(s)

Capability Entry(s) are used to specify standards and profiles, with which a node is compliant or supports. Nodes may also use capability entries to exchange vendor unique parameters or information.

**Table 65: RNC Capability Entry**

Byte	Item	Size (Bytes)
0	Flags	1
1	Document Identifier	1
2	Low Revision	1
3	High Revision	1
4-5	Reserved	0 or 2
6-7	Extension Length	0 or 2
8->	Extension	0 or n

The **Flags** field is as follows:

- **Bit 7 – Invalidate Previous**

This flag is only meaningful when the RNC Flags Select bit is set to one. Furthermore, it may only be set in the first Capability Entry in the RNC Payload. When the RNC Flags Select field and the Invalidate Previous field are both set to one, then the node issuing the RNC is requesting that the responding node invalidate this Capability Entry. All bytes of the Capability Entry marked with the Invalidate flag must match the values set in a prior RNC exchange. When the Invalidate Previous field is reset(0), the responding node selects one Capability Entry to return in the RNC\_ACC.

Since the drive does not support the Select Flag (it must be set to 0), the Invalidate Previous Flag has no meaning and is ignored.

- **Bit 6 – Extended**

When this flag is set to zero, the Capability Entry shall be exactly 4 bytes long. If this flag is set to one, the length of the Capability Entry is 4 bytes plus the length of the Extension.

- **Bits 5-4 – Vendor Unique**

- **0 0** Specifies that the Document Identifier field should be interpreted according to Table 66.
- **0 1** Specifies a Vendor Unique Document Identifier.
- **1 0** Specifies a Vendor Unique Document Identifier as defined by the vendor of the N\_Port receiving the RNC payload.
- **1 1** Reserved

- **Bits 3-2 – Reserved**

- **Bits 1-0 - Preference**

Preference is a two bit value that indicates the level of support or performance relative to the other capabilities supported by the node. It is used to aid a node in selecting a specific capability when multiple capabilities are supported. The Preference field has a range from 0 to 3.

- **0 0 Best**
- **0 1**

• 1 0

• 1 1 Worst

The Preference field is ignored.

The **Document Identifier** field specifies which Profile or Standard is associated with each Capability Entry. Valid Document Identifiers are listed in Table 66. If the Vendor Unique Flag is set to a value other than 00h, then the Document Identifier specifies a vendor unique capability.

**Table 66: Document Identifiers**

Profile or standard name	Identifier	Supported
Reserved	00h	N
FC-LE	01h	N
FC-SB	02h	N
IPI-3	03h	N
SCSI-FCP	04h	Y
FC-FP	05h	N
Reserved	06h-0Fh	N
FC-GS	10h	N
FC-FG	11h	N
FC-SW	12h	N
FC-AL	13h	Y
Reserved	14h-1Fh	N
IBM/HP/Ancor FC-PH 4.2 Deviations	20h	N
FCSI Mixed Mode SCSI Profile	21h	N
FCSI Class 2 SCSI Profile	22h	N
FCSI IP Profile	23h	N
FCSI IP Class 2 Profile	24h	N
FC-PLDA – Private Loop Direct Attach	25h	Y
FLA Fabric Loop Attach Profile	26h	Y
FCA IP Profile	27h	N
Reserved	28h-FFh	N

The **Low Revision** field defines the lowest revision of the specified document supported. The field represents a decimal revision number between 0.0 and 25.5.

The **High Revision** field defines the highest revision of the specified document supported. The field represents a decimal revision number between 0.0 and 25.5.

The **Extension Length** field is a two byte unsigned integer that specifies the number of additional bytes present in the Capability Entry. This number includes itself, the preceding reserved field, and the length of Extension Field.

The **Extension** field is used to specify any additional bit flag, parameters, or other information defined by the document associated with the Capability Entry. The drive does not currently make use of Extension field, therefore all Capability Entries returned by the drive are 4 bytes in length.

### 17.3.13 Re-instate Recovery Qualifiers (RRQ)

The Re-instate Recovery Qualifier (RRQ) can be sent by the Initiator to the drive, as an indication that the Recovery Qualifier (S\_ID, D\_ID, OX\_ID, RX\_ID, SEQ\_ID, and SEQ\_CNT) for an aborted exchange may be reused. RRQ is not required by the drive following an aborted exchange. Following an ABTS the drive allows immediate reuse of the Recovery Qualifier. The drive responds to RRQ with a valid ACC.

The following tables show the RRQ payload and the RRQ ACC payload.

**Table 67: RRQ payload**

Byte	Item	Size (Bytes)
0-3	Command Code = 12000000h	4
4	reserved	1
5-7	Originator S_ID	3
8-9	OX_ID	2
10-11	RX_ID	2
12 - 43	Association Header (Opt)	32

**Table 68: RRQ ACC payload**

Byte	Item	Size (Bytes)
0-3	ACC Code = 02000000h	4

The drive performs no protocol checking on the RRQ payload. When it recognizes an ELS with 12h in byte 0, it simply responds with an RRQ ACC.

### 17.3.14 Third Party Process Logout (TPRLO)

The TPRLO request is used to invalidate the operating environments between the specified image(s) at the recipient N\_Port (i.e., the drive). These image pairs being invalidated are assumed to have been previously established with a Process Login (PRLI). The originator establishing the process image (with the PRLI ELS) can itself terminate the image with a Process Logout (i.e. PRLO) ELS. An originator can terminate the process pair established between another third party originator and the recipient (i.e. the drive) using TPRLO. TPRLO has the same effect as if the third party originator performed PRLO. Upon execution of a valid TPRLO ELS, the drive will set all tasks, reservations, mode page parameters, and status for the specified image pairs to the state they would have after a SCSI device reset or power-on reset.

**Table 69: TPRLO payload**

Byte	Item	Size (Bytes)
0	Command Code = 24h	1
1	Page Length = 10h	1
2-3	Payload Length = 14h	2
4-max	Logout service parameter pages	n*16

**Table 70: TPRLO ACC payload**

Byte	Item	Size (Bytes)
0	ACC Cmd Code = 02h	1
1	Page Length = 10h	1
2-3	Payload Length = 14h	2
4-max	Logout service parameter response pages	n*16

#### 17.3.14.1 Third Party Process Logout Service Parameter page

**Table 71: Logout Service Parameter page**

Byte	Item	Size (Bytes)
0	TYPE Code = 08h	1
1	TYPE Code Extension = 00h	1
2-3	Flags	2
4-7	Third Party Originator Process Associator	4
8-11	Responder Process Associator	4
12	Reserved	1
13-15	Third Party Originator N_Port ID	3

The **TYPE Code** field for SCSI-FCP is 08h, and the **TYPE Code Extension** field is 00h.

The **Flags** field is as follows:

- **Bit 15 - Third Party Originator Process Associator Valid**

When set to one, the Third Party Originator Process Associator field of this Service Parameter page is valid.

- **Bit 14 - Responder Process Associator Valid**

When set to one, the Responder Process Associator field of this Service Parameter page is valid.

- **Bit 13 - Third Party Originator N\_Port ID Valid**

When set to one, the Third Party N\_Port ID field of this Service Parameter page is valid.

- **Bit 12 - Global Process Logout**

When set to one, all established image pairs for all N\_Ports with which Process Login has been performed will be removed. This will be as if all N\_Ports that had previously executed a Process Login (i.e. PRLI) with the drive had now executed the PRLO ELS. When this bit is set, only one logout parameter page shall be transmitted, and only the TYPE Code and the TYPE Code Extension fields shall have meaning.

- **Bits 11-0 - Reserved**

The **Third Party Originator Process Associator** identifies a group of related processes (an 'image') within the originator.

The **Responder Process Associator** identifies a group of related processes (an 'image') within the responder.

The **Third Party N\_Port ID** specifies the N\_Port associated with the image to be removed.

### 17.3.14.2 Third Party Process Logout Response Service Parameter page

**Table 72: Logout Response Service Parameter page**

Byte	Item	Size (Bytes)	Drive Response
0	TYPE Code	1	08h
1	TYPE Code Extension	1	00h
2-3	Flags	2	XX 00h
4-7	Third Party Originator Process Associator	4	00 00 00 00h
8-11	Responder Process Associator	4	00 00 00 00h
12	Reserved	1	00h
13-15	Third Party Originator N_Port ID	3	XX XX XXh

The **TYPE Code** field for SCSI-FCP is 08h, and the **TYPE Code Extension** field is 00h.

The **Flags** field is as follows:

- **Bit 15 - Third Party Originator Process Associator Valid**

The drive returns 0b in this field.

- **Bit 14 - Responder Process Associator Valid**

The drive returns 0b in this field.

- **Bit 13 - Third Party Originator N\_Port ID Valid**

The drive will echo this bit from the TPRLO payload. It is not valid when the Global Process Logout flag is set to one.

- **Bit 12 - Global Process Logout**

The drive will echo this bit from the TPRLO payload.

- **Bits 11-8 - Accept Response Code**

See Table 56.

- **Bits 7-0 - Reserved**

The **Originator Process Associator** and **Responder Process Associator** fields are not used.

The drive will echo the **Third Party N\_Port ID** field from the TPRLO request payload when the **Third Party Originator N\_Port ID Valid Flag** is set to one and the **Global Process Logout Flag** is set to zero.

### 17.3.15 Request Node Identification Data (RNID)

The Request Node Identification Data ELS provides a mechanism for a node to acquire Node Identification Data from other nodes in a Fibre Channel fabric. This function is normally used by nodes that wish to determine the topology of the network to which they are attached.

The normal response to a RNID Req is RNID ACC from the drive containing the requested Node Identification information. RNID is available prior to LOGIN.

Table 73: “RNID payload” shows the RNID payload.

**Table 73: RNID payload**

Item	Size (Bytes)
hex '78 00 00 00'	4
Node Identification Data Format	1
Reserved	3

The **Node Identification Data Format** specifies the format of Node Identification Data returned from the drive. Acceptable values for this field are 00h (Common Node Identification Data only) or DFh (Topology Discovery data). If this field is set to any other value, the drive will return a LS\_RJT containing a reason code of 03h "Logical Error" and a reason code explanation of 2Ah "No additional explanation".

Table 74: “RNID accept payload” shows the RNID ACC payload.

**Table 74: RNID accept payload**

Item	Size Bytes
hex '02 00 00 00'	4
Node Identification Data Format	1
Common Node-Identification-Data Length	1
Reserved	1
Specific Node-Identification-Data Length	1
Common Node Identification Data	0 or 16
Specific Node Identification Data	0-max

The **Node Identification Data Format** specifies the format of Node Identification Data returned from the drive. The drive sets this field to the same value that was in the RNID Request.

The **Common Node-Identification-Data Length** specifies the length of the Common Node-Identification-Data. This field is set to 10h.

The **Specific Node-Identification-Data Length** specifies the length of the Specific Node-Identification-Data. This field is set to 34h if the Node Identification Data Format was set to DFh (Topology Discovery Data) or 0h otherwise.

**Common Node-Identification-Data** specifies the port's 8-byte Node\_Name and 8-byte Port\_Name. The format is defined in Table 75: "Common Node Identification Data".

**Table 75: Common Node Identification Data**

Format	Size (Bytes)
N_Port_Name	8
Node_Name	8

The **Specific Node-Identification-Data** specifies Topology Discovery Data whose format is described in Table 76: "Topology Discovery Specific Node Identification Data". This Data is only returned when the **Node Identification Data Format** is set to DFh "Topology Discovery Data".

**Table 76: Topology Discovery Specific Node Identification Data**

Format	Size (Bytes)
Global ID	16
Unit Type	4
Physical Port Number	4
Number of Attached Nodes	4
IP Version	2
UDP Port Number	2
IP Address	16
Reserved	2
Topology Discovery Flags	2

The **Global ID** field is a World Wide unique name whose format is identical to the Common Node-Identification-Data field as specified in the table.

The **Unit Type** field specifies the type of device returning the Node-Identification-Data. Valid values for this field are shown in Table 77: "Topology Discovery Unit Type".

**Table 77: Topology Discovery Unit Type**

Value - hex	Type
'00 00 00 00'	Reserved
'00 00 00 01'	Unknown
'00 00 00 02'	Other (none of the following)
'00 00 00 03'	Hub
'00 00 00 04'	Switch
'00 00 00 05'	Gateway
'00 00 00 06'	Converter
'00 00 00 07'	HBA
'00 00 00 08'	Proxy-agent
'00 00 00 09'	Storage device (disk, CD, tape, etc.)
'00 00 00 0A'	Host
'00 00 00 0B'	Storage subsystem (raid, library, etc.)
'00 00 00 0C'	Module (subcomponent of a system)
'00 00 00 0D'	Software driver
'00 00 00 0E' - 'FF FF FF FF'	Reserved

The drive returns a value of 9h in this field.

The **Physical Port Number** specifies the port that received the RNID REQ. Valid values are 00h if the RNID was received on port A and 01h if the RNID was received on port B.

The **Number of Attached Nodes** field specifies the number of nodes attached to the node returning the RNID ACC. Since the drive does not perform any topology discovery, it sets this field to 0h.

The **IP Version** field specifies the level of IP supported. Since the drive does not support the IP protocol, it sets this field to 0h.

The **UDP Port** field specifies the numerical value that identifies a port using the User Datagram Protocol. Since the drive does not support UDP, it sets this field to 0h.

The **IP Address** specifies the IP address of the node. Since the drive does not support IP, this field is set to 0h.

The **Topology Discovery Flags (TDF)** are defined in Table 78: “Topology Discovery Flags” .

**Table 78: Topology Discovery Flags**

Byte	BIT								Default request values
	7	6	5	4	3	2	1	0	
0	Reserved						TDF		000h

The **Topology Discovery Support** flag signals that the node supports further Topology Discovery inquiries. This flag is set to 0 by the drive.

The **Loop Position Valid** flag indicates that multiple Node Identification Data records are reported in the order detected by a Loop Position Report Primitive. The drive returns only a single Node Identification Data record and sets this flag to 0.

### 17.3.16 Report Port Speed Capabilities (RPSC)

The Report Port Speed Capabilities ELS provides a mechanism for a port to report its current and potential link operating speeds. The response to the RPSC payload is an LS\_ACC response which indicates speed capabilities and current operating speeds of each port.

**Table 79: RPSC payload**

Byte	Item	Size (Bytes)
0-3	Command Code = 7D000000h	4

**Table 80: RPSC ACC payload**

Byte	Item	Size (Bytes)
0	ACC Cmd Code = 02h	1
1	Reserved = 0	1
2-3	Number of Entries = 0002h	2
4-5	Port 1 Speed Capabilities = E000h	2
6-7	Port 1 Operating Speed	2
8-9	Port 2 Speed Capabilities = E000h	2
10-11	Port 2 Operating Speed	2

The **Speed Capabilities** fields indicate that the drive is capable of 1Gb/sec, 2 Gb/sec, and 4 Gb/sec operations.

The **Operating Speed** fields indicate the port's current operating speed as follows: 8000h for 1Gb/sec, 4000h for 2 Gb/sec, or 2000h for 4 Gb/sec.

## 17.4 Common Fibre Channel Services

Common Fibre Channel Service Request uses the Common Transport (CT) Interface to communicate with FC Fabric Servers. The CT interface provides several Information Units, (CT\_IU)s, which provide the transport mechanism between service requestors and their servers.

In CT\_IU frames, the TYPE field in the frame header is set to 20h (Fibre Channel Service). R\_CTL is either 02h (FC-4 Device\_Data, Unsolicited Control) for a Request or 03h (FC-4 Device\_Data, Solicited Control) for a Reply.

Each CT\_IU payload starts with a 16 byte CT Header as shown in Table 81.

**Note:** Common FC Services are used to communicate with the Fabric Name Server and are only issued by the drive when it is operating as a Public Loop Device.

**Table 81: Payload of a CT Header**

Byte	Item	Size (Bytes)
0	FC_CT	1
1-3	IN_ID	3
4	FCS_Type	1
5	FCS_Subtype	1
6	Options	1
7	Reserved	1
8-9	Command/Response Code	2
10-11	Maximum/Residual Size	2
12	Reserved	1
13	Reason Code	1
14	Reason Code Explanation	1
15	Vendor Unique	1

The **FC\_CT** field contains the FC\_CT revision. The drive always sets this value to 0x01.

**IN\_ID** is a reserved field that may be used to carry the S\_ID of the original requestor between different servers in the fabric. Its value in the FC\_ACC/FC\_FJT frame may be non zero if it was used.

The **FCS\_Type** indicates which FC Service is requested and the **FCS\_Subtype** specifies which server will process the request. The drive does not check the FCS\_Type/FCS\_Subtype values returned by the Name Server in the FS\_ACC/FS\_RJT.

The **Options** field specifies various options used during FCS processing. The drive sends a value of 0x00, which specifies that this request must complete before another can be attempted.

The **Command/Response Code** field identifies specific Fibre Channel Service Information Units (FS\_IUs). The Command/Response Code also determines the type of FS\_IU. Command codes are as shown in Table 82.

**Table 82: Command/Response Codes**

Value	Description
0000h	Non-(FS_IU)
0001h - 7FFFh	Fibre Channel Service Requests (FS_REQ)
8001h	Fibre Channel Service Reject (FS_RJT)
8002h	Fibre Channel Service Accept (FS_ACC)
other values	Reserved

The drive supports only the Command code of 0217h, which specifies a RFT\_ID request.

The **Maximum/Residual Size** field is used by the sender of an FS\_REQ to indicate the maximum number of bytes it can accept in an FS\_ACC payload. If the size of the responder's FS\_ACC payload is greater than this value, the responder will

transfer only the number of bytes requested and set the Maximum/Residual field in the FS\_ACC to the number of residual bytes that were not transferred.

## 17.4.1 Register FC-4 Types (RFT\_ID)

The drive uses RFT\_ID to register its FC-4 type, (SCSI-FCP), with the Fabric Name Server. An RFT\_ID request is sent to the well-know address FFFFFCh (Fabric Name Server) and must be attempted after a successful FLOGI.

**Table 83: RFT\_ID payload**

Byte	Item	Size (Bytes)
0 - 15	CT_IU Header	16
16	Reserved	1
17 - 19	S_ID of sending NL_Port	3
20 - 51	Supported FC-4 types bit map: byte 22 = 0x01, all others = 0x00	32

As with all Common Transport requests, the payload of an RFT\_ID starts with the CT\_IU header. The FCS\_Type value of the CT\_IU Header is set to FCh to indicate a Directory Service Request, while the FCS\_Subtype value is set 02h to indicate that the request is directed to the Name Server. The Command code is set to 0217h to specify an RFT\_ID request. For an RFT\_ID\_ACC/RJT, the Command/Response code is set to 8001h for a RFT\_ID\_RJT and 8002h for RFT\_ID\_ACC. If the response was a FA\_RJT, the Reason Code, Reason Code Explanation, and Vendor Unique fields would be set to indicate which error condition occurred. The drive does not check any other fields in an FS\_ACC/RJT payload.

The **Supported FC-4 Bitmap** indicates which FC-4 protocols the RFT\_ID requestor supports. The drive sets the eighth bit of this bitmap to indicate that it supports FC-4 type 08h (SCSI-FCP).

**Table 84: RFT\_ID ACC/RJT payload**

Byte	Item	Size (Bytes)
0 - 15	CT_IU Header	16

**Table 85: FS\_RJT Reason Codes**

Encoded value	Description
<b>0000 0001</b>	Invalid command code
<b>0000 0010</b>	Invalid version level
<b>0000 0011</b>	Logical error
<b>0000 0100</b>	Invalid IU size
<b>0000 0101</b>	Logical busy
<b>0000 0111</b>	Protocol error
<b>0000 1001</b>	Unable to perform command request
<b>0000 1011</b>	Command not supported
<b>others</b>	Reserved
<b>1111 1111</b>	Vendor Unique Error

**Table 86: FS\_RJT Reason Explanations**

Encoded value	Description
<b>00</b>	No additional explanation
<b>01</b>	Port Identifier not registered
<b>02</b>	Port Name not registered
<b>03</b>	Node Name not registered
<b>04</b>	Class of Service not registered
<b>05</b>	IP address not registered
<b>06</b>	Initial Process Associator not registered
<b>07</b>	FC-4 TYPEs not registered
<b>08</b>	Symbolic Port Name not registered
<b>09</b>	Symbolic Node Name not registered
<b>0A</b>	Port Type not registered
<b>10</b>	Access Denied
<b>11</b>	Unacceptable Port Identifier
<b>12</b>	Data base empty
<b>Others</b>	Reserved

## 17.5 FC-AL timers

Table 87: FCAL timer values

Timer	Description	Value (PLDA/FLA)*
AL_TIME	Arbitrated Loop Timeout Value	15 ms
LIS_HOLD_TIME	Loop Initialization Sequence Hold Time	1 ms
R_T_TOV	Receiver Transmitter Timeout Value	100 ms
E_D_TOV	Error Detect Timeout Value	2 sec./2 sec.*
R_A_TOV	Resource Allocation Timeout Value	2 sec./10 sec.*
RR_TOV	Resource Recovery Timeout Value	2 sec.
LP_TOV	Loop Timeout Value	2 sec.

The drive uses FCAL timers as specified in PLDA 2.1 as required in the standard.

- **AL\_TIME**

AL\_TIME represents two times the worst case round trip latency for a very large loop.

- **LIS\_HOLD\_TIME**

LIS\_HOLD\_TIME is the maximum amount of time between when a node receives a Loop Initialization Sequence until it forwards it to the next node.

- **R\_T\_TOV**

R\_T\_TOV is used by the receiver logic to detect a Link Failure. A Link Failure is defined as loss of synchronization for a period greater than R\_T\_TOV.

- **E\_D\_TOV**

E\_D\_TOV is the minimum time a port shall wait for the next expected frame in a sequence before detecting an error.

- **R\_A\_TOV**

R\_A\_TOV is defined by the PLDA to be two distinct timers.

- **R\_A\_TOV<sub>SEQ\_QUAL</sub>** defines the minimum time a port shall wait before reuse of the sequence qualifiers SEQ\_CNT and SEQ\_ID. The PLDA defines the value of R\_A\_TOV<sub>SEQ\_QUAL</sub> to be zero seconds.

Twice the value of R\_A\_TOV<sub>ELS</sub> defines the minimum time a port shall wait for the response to an Extended Link Service Request. The PLDA defines this value to be two seconds. Therefore a port must wait twice this value (four seconds) before timing out an ELS.

**Note:** In the FLA, there is no split definition of the R\_A\_TOV value. One timer value is used for both R\_A\_TOV<sub>SEQ\_QUAL</sub> and R\_A\_TOV<sub>ELS</sub>.

- **RR\_TOV**

RR\_TOV is the minimum time a target shall wait for an Initiator to perform exchange authentication following LIP. If this timer expires, the Target will implicitly log out the Initiator and free up the resources associated with that timer. An RR\_TOV timer is maintained for each Initiator that has logged in.

- **LP\_TOV**

LP\_TOV is used to keep a Loop from deteriorating due to protocol errors or lost Ordered Sets.

LP\_TOV is also used during initialization and to reset the fairness window.

### **17.5.1 Link Failure**

Link Failure is defined when a receiver has continuously detected loss of synchronization for a period of R\_T\_TOV. When this occurs, the drive will transmit LIP(F8) on that port.

## **17.6 Invalid frame delimiter**

If an invalid frame delimiter is received for a:

- FCP\_DATA frame, the exchange shall terminate with a CHECK CONDITION status. The resulting Sense data will have the Sense Key set to *Aborted command* and the Additional Sense Code set to *Data Phase Error*.
- non-FCP\_DATA frame, the frame shall be discarded and ignored.

## 18.0 SCSI-FCP

This section describes the drive's implementation of SCSI-FCP. SCSI-FCP is the FC-4 mapping recommended by the Disk Profile. It maps the ANSI SCSI protocol onto the FC-PH functions.

**Note:** PLDA 2.1 specifies: "Reserved FC-PH fields are not required to be checked for zeroes. Validity bits set to 0 remove any requirement to check the corresponding field for zeroes (e.g., if F\_CTL bit 3=0, receiving N\_Ports are not required to verify that the parameter field in word 5 of the frame header contains zeroes)." As such, the drive does not validate 1) reserved FC fields or 2) fields that are not reserved but are not valid for the current frame (as the example above with F\_CTL bit 3). This does not apply to any reserved field checking and testing within the FCP\_CDB. These fields are checked as per ANSI SCSI requirements.

### 18.1 Terminology

The SCSI Architecture Model (SAM) defines a new SCSI vocabulary in order to remain independent from physical protocol and interconnect. Common SCSI-2 terms have been replaced and new ones introduced.

As might be expected, the terminology used to describe SCSI-FCP is a problem. It needs elements of SAM and Fibre Channel. Most of the Fibre Channel terms have been introduced in 1.0, "FC-AL Attachment", and some essential SAM terms are covered here. However, SAM is still recommended reading!

SCSI-FCP describes all communication in terms of Fibre Channel Information Units (IUs). FC-PH defines these simply as "sequences that have special meaning to the FC-4" (i.e. SCSI-FCP).

IUs are used to send commands, data, and status; bus phases are part of parallel SCSI and no longer exist. Execution of a command requires several IUs to pass between the Target and Initiator so an I/O Process (IOP) equates to a Fibre Channel exchange. In fact, the exchange ID is used as the command tag.

An IOP is represented in the Target by a Task. The Initiator uses Task Management functions to control execution of the task in the Target. IUs are used to transfer Task Management functions.

SAM defines a Target as consisting of a Task Manager and one or more Logical Units. The Task Manager handles all the Task Management functions and the logical unit handles commands.

The logical unit consists of a Target and a Task Set. The Target actually executes the commands and the task set is simply what used to be known as the Command Queue.

SCSI-FCP recognizes that Targets and Initiators may simply be software procedures and therefore calls them Processes.

## 18.2 Information Units

SCSI-FCP defines a number of IUs that are used to describe the mapping of SAM Device and Task Management functions. The Disk Profile defines an 'FCP Feature Set', which is a subset of those IUs.

This section defines the IUs implemented by the drive (see Table 88).

**Table 88: Information Units (IUs)**

IU	SAM primitive	Data block		F/M/L	SI	M/O
		CAT	Content			
T1	Command Request	6	FCP_CMND	F	T	M
T6	Data Out action	1	FCP_DATA	M	T	M
I1	Data delivery request	5	FCP_XFER_RDY (WRITE)	M	T	M
I3	Data In action	1	FCP_DATA	M	H	M
I4	Response	7	FCP_RSP	L	T	M

**Note:**

**Key:**

- SAM = SCSI-3 Access Method
- IU = Information Unit
- CAT = Information category of Device\_Data frame
- F/M/L = First/Middle/Last IU of Sequence
- SI = Sequence Initiative
- H = Hold Sequence Initiative
- T = Transfer Sequence Initiative
- M/O = Mandatory/Optional

## 18.2.1 FCP\_CMND

The FCP\_CMND IU carries either a SCSI command to be executed or a Task Management function to be performed.

**Table 89: FCP\_CMND payload**

Byte	Field	Description	Size (Bytes)
0 -7	FCP_LUN	Logical Unit Number	8
8-11	FCP_CNTL	Control Field	4
12 - 27	FCP_CDB	SCSI Command Descriptor Block	16
28-31	FCP_DL	Data Length	4

### 18.2.1.1 FCP\_LUN

The FCP\_LUN field identifies the logical unit number within the Target. The drive is a single LUN with address 0000 0000 0000 0000h.

### 18.2.1.2 FCP\_CNTL

The FCP\_CNTL field contains a number of control flags.

**Table 90: FCP\_CNTL field**

Byte	Description	Size (Bytes)
0	Reserved	1
1	Task Codes	1
2	Task Management function flags	1
3	Execution management codes	1

The **Task Codes** field contains the Task Attributes, as shown in Table 91. The Task Attributes are described in 18.3, “Task Attributes”, on page 109.

**Table 91: Task Attribute values**

Value	Attribute
xxxx x000b	Simple_Q
xxxx x001b	Head_of_Q
xxxx x010b	Ordered_Q
xxxx x100b	ACA_Q (not supported)
xxxx x101b	Untagged

The **Task Management Function flags** are used to request Task Management functions, as shown in Table 92. The Task Management functions are described in 18.4, “Task Management functions”, on page 110.

**Table 92: TMF flag values**

Value	Function
1000 0000b	Terminate Task
0100 0000b	Clear ACA (not supported)
0010 0000b	Target Reset
0000 0100b	Clear Task Set
0000 0010b	Abort Task Set

The **Execution management codes** field contains flags, as follows:

**Bits 7-2 - Reserved**

**Bit 1 - Read Data**

When set to one, this flag indicates that the Initiator expects FCP\_DATA IUs for the task to be in the direction opposite to the direction of the FCP\_CMND IU. This is a SCSI READ type operation.

**Bit 0 - Write Data**

When set to one, this flag indicates that the Initiator expects FCP\_DATA IUs for the task to be in the same direction as the FCP\_CMND IU. This is a SCSI WRITE type operation.

**18.2.1.3 FCP\_CDB**

The **FCP\_CDB** field contains the SCSI CDB to be executed by the addressed logical unit. This field is ignored if any of the Task Management function flags are set.

This is a 16-byte field. Bytes beyond the end of the CDB are ignored by the Target and may have any value.

**18.2.1.4 FCP\_DL**

The **FCP\_DL** field contains a count of the greatest number of data bytes expected to be transferred by execution of the SCSI CDB. An FCP\_DL field of zero indicates that no data transfer is expected and that no FCP\_XFER\_RDY or FCP\_DATA IUs shall be transferred.

## 18.2.2 FCP\_XFER\_RDY

The FCP\_XFER\_RDY IU indicates that the Target is prepared to perform all or part of the data transfer for a command. During WRITE operations, the FCP\_XFER\_RDY IU indicates the amount of data that the Target expects from the Initiator. Since the Target has planned buffer resources based on that amount of data, the Initiator is expected to provide exactly the amount requested.

**Table 93: FCP\_XFER\_RDY payload**

Byte	Field	Description	Size (Bytes)
0-3	DATA_RO	Relative Offset	4
4-7	BURST_LEN	Length of FCP_DATA IU that follows	4
8-11	Reserved		4

The **DATA\_RO** field indicates the contents of the RLTV\_OFF field for the first data byte of the next FCP\_DATA IU. The RLTV\_OFF field is part of the frame header.

The **BURST\_LEN** field indicates the amount of buffer space prepared for the next FCP\_DATA IU and requests an IU of that exact length.

## 18.2.3 FCP\_DATA

SCSI data transfers may be performed by one or more data delivery requests, each one performing a transfer no longer than the maximum burst length defined by the parameters of the disconnect/reconnect mode page.

## 18.2.4 FCP\_RSP

The content of the FCP\_RSP IU is as shown in Table 94.

**Table 94: FCP\_RSP payload**

Byte	Field	Description	Size (Bytes)
0-7	Reserved		8
8-11	FCP_STATUS	Field Validity and SCSI Status	4
12-15	FCP_RESID	Residual Count	4
16-19	FCP_SNS_LEN	Length of FCP_SNS_INFO field	4
20-23	FCP_RSP_LEN	Length of FCP_RSP_INFO field	4
24->	FCP_RSP_INFO	FCP Response Information	m
24+m->	FCP_SNS_INFO	SCSI Sense Information	n

### 18.2.4.1 FCP\_STATUS

The **FCP\_STATUS** field is normally zero upon successful completion of an IOP.

**Table 95: FCP\_STATUS field**

Byte	Description	Size (Bytes)
0-1	Reserved	2
2	Flags	1
3	SCSI Status byte	1

The **Flags** field contains the following:

#### **Bits 7-4 - Reserved**

#### **Bit 3 - FCP\_RESID\_UNDER**

When set to one, this flag indicates that the **FCP\_RESID** field is valid and contains a count of the number of bytes that were expected but not received.

#### **Bit 2 - FCP\_RESID\_OVER**

When set to one, this flag indicates that the **FCP\_RESID** field is valid and contains a count of the number of bytes that could not be transferred because **FCP\_DL** was not sufficient.

#### **Bit 1 - FCP\_SNS\_LEN\_VALID**

When set to one, this flag indicates that the **FCP\_SNS\_LEN** field is valid and contains a count of the number of bytes in the **FCP\_SNS\_INFO** field.

#### **Bit 0 - FCP\_RSP\_LEN\_VALID**

When set to one, this flag indicates that the **FCP\_RSP\_LEN** field is valid and contains a count of the number of bytes in the **FCP\_RSP\_INFO** field.

The **SCSI Status byte** field is defined in 20.0, “SCSI Status Byte”, on page 307.

### 18.2.4.2 FCP\_RESID

This field contains a count of the number of residual data bytes that were not transferred for this SCSI command.

### 18.2.4.3 FCP\_SNS\_LEN

This field contains a count of the number of valid bytes in the **FCP\_SNS\_INFO** field.

### 18.2.4.4 FCP\_RSP\_LEN

If the **FCP\_RSP\_LEN\_VALID** flag in the **FCP\_STATUS** field is set to 1b, this field contains a count of the number of valid bytes in the **FCP\_RSP\_INFO** field.

Valid values are 0, 4, and 8.

### 18.2.4.5 FCP\_RSP\_INFO

This field contains information describing only the protocol failures detected during the execution of an IOP.

**Table 96: FCP\_RSP\_INFO field**

Byte	Description	Size (Bytes)
0-2	Reserved	3
3	RSP_CODE	1

The content of the **RSP\_CODE** field is defined below.

**Table 97: RSP\_CODE definitions**

Code	Description
00h	No Failure (Function Complete)
01h	FCP_DATA length different from BURST_LEN
02h	FCP_CMND Fields Invalid
03h	FCP_DATA_RO mismatch with FCP_XFER_RDY DATA_RO
04h	Function Rejected
05h	Service Delivery or Target Failure
06-FFh	Reserved

### 18.2.4.6 FCP\_SNS\_INFO

This field contains the Sense information specified by SCSI (see 22.1, “SCSI Sense Data Format”, on page 349).

FCP\_SNS\_INFO is only returned if the SCSI Status byte in the FCP\_STATUS field is set to CHECK CONDITION status. Refer to 18.5.3, “Autosense”, on page 113 for more details.

## 18.3 Task Attributes

Task Attributes are specified in the Task Codes field of the FCP\_CMND IU. They apply only to the SCSI command contained within the FCP\_CDB field and are ignored if any of the Task Management function flags are set.

A task shall have one of the following attributes:

#### Simple Queue

This attribute specifies that the task shall be accepted into the task set and executed after tasks with the Head of Queue attribute and tasks with the Ordered attribute that were received earlier. The order of execution, with respect to other tasks with the Simple attribute, is determined by the Queue Algorithm currently in effect. Refer to the Queue Algorithm Modifier field in 19.10.9, “Mode Page 0A (Control Mode Page Parameters)”, on page 186.

#### Head of Queue

This attribute specifies that the task shall be accepted into the task set and executed next. Successive tasks received with Head of Queue attribute will be executed in LIFO order.

### Ordered Queue

This attribute specifies that the task shall be accepted into the task set and executed in the order received. All tasks received earlier shall complete before this task. All tasks received later shall complete after this task, except for tasks received with Head of Queue attribute.

### Untagged

This attribute specifies that the task shall be accepted into the task set according to the rules for an untagged task. Only one untagged task can exist for each logical unit/Initiator pair. A second untagged task for the same pair is treated as an overlapped command. SCSI-FCP commands are inherently tagged with the OXID/RXID specified in the frame header. Therefore, commands sent with the untagged task attribute are handled as if they had the Ordered Queue attribute.

**Note:** The uncoupled nature of FCAL makes it impossible for the drive to perform command overlap checking. (See Section 21.6.3 "Overlapped Commands")

## 18.4 Task Management functions

Task Management functions allow an Initiator to explicitly control the execution of one or more Tasks. SAM defines the following:

- Abort Task (Implemented as ABTS BLS)
- Abort Task Set
- Reset LUN
- Clear ACA (not supported)
- Clear Task Set
- Target Reset
- Terminate Task

**Note:** The following description applies to all Task Management functions except Abort Task, which is described separately in 18.4.1, "Abort Task (Implemented as ABTS BLS)", on page 111.

Task Management functions are transmitted in a new exchange using a T1 FCP\_CMND IU (see 18.2.1, "FCP\_CMND", on page 105). The Task Management function flags in the IU specify the required function. If any flag is set, all CDB related fields of the IU are ignored (FCP\_CDB, FCP\_DL, the Task Codes and Execution Management fields of FCP\_CNTL). Only one Task Management function flag may be set.

The Target responds to a Task Management function with an I4 FCP\_RSP IU (see 18.2.4, "FCP\_RSP", on page 107). The RSP\_CODE in the FCP\_RSP\_INFO field shall be as shown in Table 98 and all other fields shall be zeroes.

**Table 98: Task Management function RSP\_CODE definitions**

Code	Description
00h	No Failure (Function Complete)
04h	Function Rejected
05h	Service Delivery or Target Failure

## 18.4.1 Abort Task (Implemented as ABTS BLS)

The Abort Task function is performed using the FC-PH link management functions. Specifically, the Abort Sequence (ABTS) Basic Link Service (BLS). Refer to 17.2.1, “Abort sequence (ABTS)”, on page 57 for a detailed description of this BLS.

Abort Task causes the Target to abort the specified task, if it exists. Previously established conditions such as Mode parameters and reservations are not affected.

The Initiator performs the Abort Task by using the FC-PH Recovery Abort Protocol. This protocol recovers any resources associated with the exchange that is being terminated.

The Initiator shall also use the recovery abort protocol for each open exchange following receipt of an FCP\_RSP with a RSP\_CODE of No Failure (Function Complete) to Abort Task Set, Clear Task Set, or Target Reset Task Management function.

The recovery abort protocol is as follows:

- The Initiator generates an ABTS sequence. This may be done regardless of whether or not the Initiator has sequence initiative. In the ABTS frame:
  - **SEQ\_ID** is set to the SEQ\_ID of an open sequence at the Initiator. If no sequence is open, any SEQ\_ID not currently in use between the Initiator and the Target may be used.
  - **SEQ\_CNT** is set to one more than the SEQ\_CNT of the last frame transmitted in the open sequence. If no sequence is open, SEQ\_CNT is zero.
  - **OX\_ID** is set to the OX\_ID assigned by the Initiator to the task that is being aborted.
  - **RX\_ID** is set to FFFFh if no FCP\_XFR\_RDY (WRITE) or READ data (READ) has been received from the Target. Otherwise, RX\_ID is set to the RX\_ID assigned by the Target to the task that is being aborted.
  - **F\_CTL** is set for Sequence Context = Initiator.
- The Target may reject the ABTS with a BA\_RJT frame only if
  1. the Target has assigned an RX\_ID to an OX\_ID in a previous frame, and
  2. the ABTS has an unknown OX\_ID/RX\_ID combination.

The reason code in the BA\_RJT is Logical error and the reason code explanation is Invalid OX\_ID-RX\_ID combination. The F\_CTL field is set to indicate that this is the last frame of the exchange.

- The target accepts the ABTS with a BA\_ACC frame. In the frame header:
  - **OX\_ID** is set from the OX\_ID in the ABTS
  - **RX\_ID** is set from the RX\_ID in the ABTS
  - **F\_CTL** is set to indicate that this is the last frame of the exchange (L\_S = 1b) and Sequence Context =Recipient.

In the frame payload:

- **SEQ\_ID** Validity is set to 00h
- **SEQ\_ID** is ignored by the recipient and may therefore be any value
- **OX\_ID** is set from the OX\_ID in the ABTS
- **RX\_ID** is set from the RX\_ID in the ABTS
- **Low SEQ\_CNT** is set to 0000h
- **High SEQ\_CNT** is set to FFFFh

## 18.4.2 Abort Task Set

Abort Task Set causes the Target to abort all tasks in the task set that were created by the Initiator. The action is equivalent to receiving a series of Abort Task requests. Previously established conditions such as Mode parameters and reservations are not affected.

### **18.4.3 Terminate Task**

The drive does not support Terminate Task. An FCP\_RSP with a RSP\_CODE of Function Rejected will be returned.

### **18.4.4 Clear ACA**

The drive does not support Clear ACA. An FCP\_RSP with a RSP\_CODE of Function Rejected will be returned.

### **18.4.5 Target Reset**

The Target Reset Task Management function causes the Target to execute a hard reset, as defined by SAM. This means:

1. Abort all tasks for all Initiators.
2. Release any device reservation.
3. Return all internal states to their initial power-on and default values, as established by PRLI.
4. Set a unit attention condition for all Initiators.

Target Reset does not affect any login state.

### **18.4.6 Clear Task Set**

Clear Task Set causes the Target to abort all tasks in the task set. The action is equivalent to receiving a series of Abort Task requests from all Initiators.

A unit attention condition shall be generated for all other Initiators with tasks in the task set. The Additional Sense Code shall be Commands cleared by another Initiator.

Previously established conditions such as Mode parameters and reservations are not affected.

### **18.4.7 Reset LUN**

The Reset LUN Task Management function causes the drive to execute a hard reset with the same actions as Target Reset. See section 18.4.5.

## **18.5 Miscellaneous**

### **18.5.1 Tags**

Using SCSI-FCP, an I/O Process equates to a Fibre Channel Exchange. All IOPs are therefore implicitly tagged by the Fully Qualified Exchange ID (FQXID).

The FQXID is the 80-bit concatenation of the S\_ID, D\_ID, OX\_ID and RX\_ID from any frame in the exchange.

### **18.5.2 Auto-Contingent Allegiance (ACA)**

In parallel SCSI-2, a CHECK CONDITION generates sense data for the faulted initiator (the one that got the CHECK CONDITION) and either suspends or aborts all commands queued by that Initiator. Execution of the next command from the faulted Initiator clears the sense data and allows queued commands to resume. This is 'Contingent Allegiance' (CA).

CA requires an interlocked interface to work. In a non-interlocked serial interface, the 'next' command could already be on its way before the faulted Initiator receives the CHECK CONDITION and sense data could be inadvertently lost.

In SCSI-3, ACA replaces the SCSI-2 Contingent Allegiance and Extended Contingent Allegiance conditions.

ACA is a condition that is created within the Target task set whenever CHECK CONDITION is returned. While it exists, all tasks in the task set are blocked (i.e., the queue is frozen). New tasks from Initiators other than the faulted Initiator are not entered into the task set and are completed with a status of ACA ACTIVE.

New tasks from the faulted Initiator are entered into the task set under two different conditions, depending on the state of the NACA bit in the CDB Control Byte of the faulting command.

1. If the NACA bit was set to 0b, the previously described SCSI-2 CA rules apply.
2. If the NACA bit was set to 1b, the new task must have the ACA attribute and there must be no other task in the task set with the ACA attribute. If these conditions are not met, the task is completed with a status of ACA ACTIVE.

**Note:** Only NACA = 0b is supported.

### 18.5.3 Autosense

Autosense is the automatic return of sense data upon completion of the task. It is equivalent to an explicit REQUEST SENSE command being executed immediately after *Check Condition* status is returned.

The sense data is returned in the I4 FCP\_RSP IU. The FCP\_SNS\_LEN field indicates how many bytes of valid sense are contained in the FCP\_SNS\_INFO field.

# 19.0 SCSI Command Set

Summaries of the SCSI commands supported by the drive are listed below. O = optional, M = mandatory

**Table 99: SCSI Commands Supported**

Type	Code	Description
M	04h	FORMAT UNIT (04), page 118
M	12h	INQUIRY (12), page 125
O	4Ch	LOG SELECT (4C), page 137
O	4Dh	LOG SENSE (4D), page 140
O	15h	MODE SELECT (15), page 165
O	55h	MODE SELECT (55), page 166
O	1Ah	MODE SENSE (1A), page 167
O	5Ah	MODE SENSE (5A), page 196
O	5Eh	PERSISTENT RESERVE IN (5E), page 197
O	5Fh	PERSISTENT RESERVE OUT (5F), page 201
O	34h	PRE-FETCH (34), page 207
M	08h	READ (6) - (08), page 208
M	28h	READ (10) - (28), page 209
O	A8h	READ (12) - (A8), page 211
O	88h	READ (16) - (88), page 212
O	7Fh/09h	READ (32) - (7F/09), page 213
O	3Ch	READ BUFFER (3C), page 215
M	25h	READ CAPACITY (10) - (25), page 222
O	9Eh/10h	READ CAPACITY (16) (9E/10), page 224
O	37h	READ DEFECT DATA (37), page 226
O	B7h	READ DEFECT DATA (B7), page 232
O	3Eh	READ LONG (3E), page 237
O	07h	REASSIGN BLOCKS (07), page 238
O	1Ch	RECEIVE DIAGNOSTICS RESULTS (1C), page 240
M	17h	RELEASE (17), page 246
O	57h	RELEASE (57), page 247
O	A3h/05h	REPORT DEVICE IDENTIFIER (A3/05), page 248
O	A0h	REPORT LUNS (A0), page 250
O	A3h/0Ch	REPORT SUPPORTED OPERATION CODES (A3/0C), page 251
O	A3h/0Dh	REPORT SUPPORTED TASK MANAGEMENT FUNCTIONS (A3/0D), page 255
M	03h	REQUEST SENSE (03), page 257
M	16h	RESERVE (16), page 258
O	56h	RESERVE (56), page 259

O	8Eh	WRITE AND VERIFY (16) - (8E), page 290
O	7Fh/0Ch	WRITE AND VERIFY (32) - (7F/0C), page 291
O	3Bh	WRITE BUFFER (3B), page 293
O	3Fh	WRITE LONG (3F), page 301
O	41h	WRITE SAME (41), page 302
O	93h	WRITE SAME (16) - (93), page 303
O	7Fh/0Dh	WRITE SAME (32) - (7F/0D), page 304

## 19.1 SCSI Control Byte

The Control Byte is the last byte of every CDB. The format of this byte is shown below.

**Table 100: SCSI Control Byte**

BIT							
7	6	5	4	3	2	1	0
VU = 0		Reserved = 0				FLAG	LINK

### VU

VU stands for Vendor Unique.

### FLAG\*\*

If Link is zero, Flag must also be zero. If Link is one, Flag may also be one. Typically this bit is used to cause an interrupt in the Initiator between linked commands.

### LINK\*\*

This bit is set to one to indicate that the Initiator desires an automatic link to the next command upon successful completion of the current command.

**Note:** \* - The drive ignores the link bit and flag bit in the CDB.

## 19.2 Abbreviations

These abbreviations are used throughout the following sections:

- LUN** Logical Unit Number. An encoded three bit identifier for the logical unit.
- VU** Vendor Unique bits
- LBA** Logical Block Address
- RSVD** Reserved
- MSB** Most Significant Byte
- LSB** Least Significant Byte

## 19.3 Byte ordering conventions

In this specification, where it is not explicitly stated, all multi-byte values are stored with the most significant byte first. For example, in a 4 byte field, byte 0 will contain the MSB and byte 3 the LSB.

## 19.4 FORMAT UNIT (04)

Table 101: FORMAT UNIT (04)

Byte	BIT							
	7	6	5	4	3	2	1	0
0	Command Code = 04h							
1	FMTPINFO	RTO_REQ	LONG LIST=0	FMT-DATA	CMPLIST	Defect List Format		
2	VU = 0							
3-4	Obsolete = 0							
5	VU = 0		Reserved = 0				FLAG	LINK

- **FMTPINFO (Format Protection Information)** set to zero specifies that the drive shall disable the use of protection information and format to the block size specified. FMTPINFO set to one specifies that the drive shall enable the use of protection information and format to the block size specified + 8 (e.g., if the block length is 512, then the formatted block length is 520). Following a successful format, the PROT\_EN bit in the READ CAPACITY (16) parameter data indicates whether protection information is enabled. When protection information is written during a FORMAT UNIT command (i.e., the FMTPINFO bit is set to one), protection information shall be written with a default value of all FF's.
- **RTO\_REQ (Reference Tag Own Request)** specifies whether the initiator or drive has ownership of the Logical Block Reference Tag field in protection information. If the FMTPINFO bit is set to zero and the RTO\_REQ bit is set to one, Check Condition status will be returned, with the sense key set to Illegal Request and the additional sense code set to Invalid Field in CDB.  
If the FMTPINFO bit is set to one and the RTO\_REQ bit is set to one, application client ownership of the Logical Block Reference Tag field is enabled, (i.e. the initiator owns the Logical Block Reference Tag field). If the FMTPINFO bit is set to one the the RRTO\_REQ bit is set to zero, application client ownership of the Logical Block Reference Tag field is disabled (i.e. the drive owns the Logical Block Reference Tag field). Following a successful format, the RTO\_EN bit in the READ CAPACITY (16) parameter data indicates whether application client ownership of the Logical Block Reference Tag field is enabled.
- **FmtData** set to one specifies that a Data Out phase follows the Command phase. The Data Out phase consists of a Parameter List header, optionally followed by an Initialization Pattern Descriptor, optionally followed by a Defect List. If FmtData=0, the following defaults are assumed: DPRY=0, DCRT=1, STPF=1, IP=0, DSP=0, Immed=0.
- **CmpLst**
  - - set to one specifies that the Grown Defect List (GList) existing prior to the issuance of the Format Unit command be discarded. If provided, the DList then becomes the GList. Following these operations, the Drive will be formatted with the PList and GList.
  - - set to zero specifies that the GList existing prior to the issuance of the Format Unit command is retained. If provided, the DList is combined with the GList to become the new GList. Following these operations, the Drive will be formatted with the PList and GList.

**Note:** The drive manages two internal defect lists and one external. The Plist is created at time of manufacture. The Glist is built after manufacture by the Initiators' use of the REASSIGN BLOCK command and the Automatic Reallocate functions. The Dlist is an external list. It is supplied by the Initiator in the Data Out phase of the FORMAT UNIT command.

- **Defect List Format** specifies the format of the defect descriptor transferred to the Target when FmtData bit is set to one. The Target supports the following three defect descriptor formats for the FORMAT UNIT command:

## Format Description

<b>000b</b>	Block format
<b>100b</b>	Bytes From Index format
<b>101b</b>	Physical Sector format

If the *FmtData* bit is set to zero, this field must also be zero. Otherwise the command will complete with a CHECK CONDITION with a sense key of *Illegal Request* and an additional sense code of *Invalid Field in CDB*.

- Notes:**It is recommended that the MODE SELECT command be issued prior to the FORMAT UNIT command to specify parameters that affect the formatting process.

The Block Length parameter of the Mode Select Parameter List's Block Descriptor is used during formatting and is saved following a successful format operation. If a MODE SELECT command has not been issued since the last reset or start-up (bring-up) sequence, then the Block Length from the previous format operation is used.

Subsequent to receiving a FORMAT UNIT command, the Target responds to commands as follows:

- All commands except REQUEST SENSE and INQUIRY return *Check Condition* status, while the format operation is an active I/O process.
- When tagged queuing is enabled (*DQue* = 0), all commands except REQUEST SENSE and INQUIRY return *Queue Full* status, while the FORMAT UNIT command is a queued I/O process.
- When tagged queuing is disabled (*DQue* = 1), all commands except REQUEST SENSE and INQUIRY return *Busy* status, while the FORMAT UNIT command is a queued I/O process
- If a REQUEST SENSE command is received while a format operation is an active I/O process, the Target returns *Good* status. The sense key is set to *Not ready* and the additional sense code and qualifier is set to *Format In Progress*.
- If an INQUIRY command is received while a format operation is an active I/O process, the Target returns *Good* status and Inquiry data as requested.

The format operation must complete successfully for the Drive to be usable. If the command is interrupted by a reset, power down, or an unrecoverable error, the Drive enters a degraded mode of operation in which reading and writing are prohibited. To exit the degraded mode, another FORMAT UNIT command must be sent by the Initiator and completed successfully by the Target.

The FORMAT UNIT command sets the *Unit Attention Condition* for all Initiators except the one that issued the FORMAT UNIT command.

## 19.4.1 Parameter List Header

Following is the format of the Parameter List Header sent during the data out phase when FmtData is set to one.

**Table 102: Format of the Parameter List Header**

Byte	BIT							
	7	6	5	4	3	2	1	0
0	Reserved = 0							
1	FOV	DPRY	DCRT	STPF=1	IP	DSP	Immed	Ignored
2	(MSB) Defect List Length (LSB)							
3								
4-n	Initialization Pattern Descriptor							
(n+1) - m	Defect Descriptor							

- **FOV** (Format Options Valid) bit set to zero indicates that the Target should use its default settings for the DPRY (0), DCRT (1), STPF (1), IP (0), and DSP (1) bits. These bits must all be set to zero in the Parameter List Header when FOV=0, or the command will be terminated with Check Condition status, sense key of Illegal Request, and additional sense code of Invalid Field in Parameter List.. FOV=1 indicates that the values set in DPRY, DCRT, STPF, IP, and DSP will be defined as specified below.
- **DPRY** (Disable Primary) bit set to zero indicates that the Target does not use portions of the medium identified as defective in the primary defect Plist for Initiator addressable logical blocks. If the Target cannot locate the Plist or it cannot determine whether a Plist exists, the Target terminates the FORMAT UNIT command as described for STPF=1. A DPRY bit set to one indicates that the Target does not use the Plist to identify defective areas of the medium. The Plist is not deleted. DPRY must be set to 0 when DCRT is set to 0.
- **DCRT** (Disable Certification) bit set to zero indicates that the Target performs a medium certification operation and generates a Certification List (Clist), and adds the Clist to the Glist. DPRY must be set to 0 when DCRT is set to 0. A DCRT bit of one indicates that the Target does not generate a Clist or perform a certification process.
 

**Note:** Since the DCRT bit is part of the Data Out phase that follows the FORMAT command, the FCERT bit in Mode Page 0 is provided to control certification when the FORMAT command is issued with no Data Out phase. If a FORMAT command is issued with a Data Out phase then FCERT is ignored.
- **STPF** (Stop Format) bit must be set to one. If one or both of the following conditions occurs, the Target terminates the FORMAT UNIT command with *Check Condition* status. The sense key is set to *Medium Error* and the additional sense code is set to *Defect List Not Found* if the first condition occurred or to *Defect List Error* if the second condition occurred.
  - The Target cannot locate a required Dlist nor determine that the list exists.
  - The Target encounters an unrecoverable error while accessing a required Dlist.
- **IP** (Initialization Pattern) bit set to zero specifies that an initialization pattern descriptor is not included and all customer data will be initialized to zeroes. An IP bit of one specifies that an Initialization Pattern Descriptor is included in the FORMAT UNIT parameter list following the parameter list header.

**Table 103: Initialization Pattern Descriptor:**

Byte	BIT							
	7	6	5	4	3	2	1	0
0	IP Modifier = 0		SI	Reserved = 0				
1	Initialization Pattern Type = 1							
2 - 3	Initialization Pattern Length (n-3)							

- **IP Modifier** must be set to 0, indicating that the drive will not modify the initialization pattern.
- **SI** (Security Initialize) bit set to one specifies that all customer data sectors, including those that have been previously reassigned, will be initialized. SI set to zero specifies that only the current customer accessible sectors will be formatted.
- **Initialization Pattern Type** must be set to one, specifying that the Initialization Pattern specified shall be repeated as required to fill each logical block.
- **Initialization Pattern Length** specifies the number of bytes that follow in the Initialization Pattern field, and must be less than or equal to the current block size, and non-zero.
- **Initialization Pattern** contains the data pattern to be written to the media.
- **DSP** (Disable Saving Parameters) bit when zero indicates the target is to save all the current MODE SELECT saveable parameters during the format operation. When the bit is one, the target is not to save the current MODE SELECT saveable parameters.
- **Immed** (Immediate) bit set to zero requests that status be returned at the end of the format operation. An immediate bit set to one requests that status be returned immediately following CDB validation and transfer of data in the Data Out phase. If the format operation, with the immediate bit set to one, terminates in error, DEFERRED ERROR SENSE data is generated.
- **Defect List Length** field specifies the total length in bytes of the defect descriptors that follow (not including the Initialization Pattern Descriptor, if any). Up to 1024 defect descriptors are allowed. The Defect List Length must be equal to four times the number of defect descriptors for BLOCK format, or eight times the number of defect descriptors for BYTES FROM INDEX and PHYSICAL SECTOR formats. Otherwise the command is terminated with Check Condition status with the sense key set to Illegal Request and the additional sense code set to Invalid Field in Parameter List.

## 19.4.2 Defect Descriptor

Three defect descriptor formats are supported. Entries are not required to be in ascending order. If an entry does not correspond to a valid user addressable media location, the command terminates with Check Condition status with the sense key set to Illegal Request and the additional sense code set to Invalid Field in Parameter List.

### 19.4.2.1 Block Format - 000b

Format of the Dlist sent during the data out phase when Dlist Format is Block format (000b) and FmtData is set to one.

**Table 104: Defect Descriptor - Block Format (for n + 1 defects)**

Byte	BIT							
	7	6	5	4	3	2	1	0
0 - 3	(MSB) Defective Logical Block Address (LSB)							
4n 4n+1 4n+2 4n+3	(MSB) Defective Logical Block Address n (LSB)							

The Block format of the Dlist is the LBA of each defective sector.

**Note:** If a Defective LBA entry, when converted to a physical sector, is equal to the physical sector of a Plist entry and DPRY = 1, then the entry is not added to the Glist.

### 19.4.2.2 Bytes From Index Format - 100b

Format of the Dlist sent during the data out phase when Dlist Format is Bytes From Index format (100b) and FmtData is set to one.

**Table 105: Defect Descriptor - Bytes From Index Format (for n = 1 defects)**

Byte	BIT							
	7	6	5	4	3	2	1	0
0 - 2	(MSB) Cylinder Number of Defect (LSB)							
3	Head Number of Defect							
4 - 7	(MSB) Defect Bytes from Index (LSB)							
8n 8n + 1 8n + 2	(MSB) Cylinder Number of Defect n (LSB)							
8n + 3	Head Number of Defect n							
8n + 4 8n + 5 8n + 6 8n + 7	(MSB) Defect (n) Bytes from Index (LSB)							

Each defect descriptor for the Bytes From Index format specifies that the sector containing this byte be marked defective. The defect descriptor is comprised of the cylinder number of the defect, the head number of the defect, and the number of the defect byte relative to index.

**Note:** If a Byte From Index entry, when converted to a physical sector, is equal to the physical sector of a Plist entry and DPRY = 1, then the entry is not added to the Glist.

### 19.4.2.3 Physical Sector Format - 101b

Format of the Dlist sent during the data out phase when Dlist Format is Physical Sector format (101b) and FmtData is set to one.

**Table 106: Defect Descriptor - Physical Sector Format (for  $n + 1$  defects)**

Byte	BIT							
	7	6	5	4	3	2	1	0
0	(MSB) <b>Cylinder Number of Defect</b> (LSB)							
1								
2								
3	<b>Head Number of Defect</b>							
4	(MSB) <b>Defect Sector Number</b> (LSB)							
5								
6								
7								
8n	(MSB) <b>Cylinder Number of Defect n</b> (LSB)							
8n + 1								
8n + 2								
8n + 3	<b>Head Number of Defect n</b>							
8n + 4	(MSB) <b>Defect (n) Sector Number</b> (LSB)							
8n + 5								
8n + 6								
8n + 7								

Each defect descriptor for the Physical Sector format specifies a defective sector. The defect descriptor is comprised of the cylinder number of the defect, the head number of the defect, and the defect's sector number.

**Note:** If a Physical Sector entry, when converted to a physical sector, is equal to the physical sector of a Plist entry and  $DPRY = 1$ , then the entry is not added to the Glist.

## 19.5 INQUIRY (12)

Table 107: INQUIRY (12)

Byte	BIT							
	7	6	5	4	3	2	1	0
0	Operation Code = 12h							
1	Reserved = 0						CmdDt =0	EVPD
2	Page Code							
3 - 4	Allocation Length							
5	VU = 0		Reserved = 0				FLAG	LINK

The INQUIRY command requests the parameters of the Target to be sent to the Initiator.

An EVPD An EVPD bit of one specifies that the target return the vital product data page identified by the Page Code field in the CDB The available VPD pages are defined in the addendum provided for each different drive model in the section entitled Inquiry Data Format.

The **Page Code** specifies which page of vital product data information the drive shall return.

Table 108: Page Code descriptions

EVPD	PAGE CODE	Description
0	0	The Target returns the standard INQUIRY data.
0	Non Zero	The drive returns <i>Check Condition</i> status with the sense key of <i>Illegal Request</i> and the additional sense code of <i>Invalid Field in CDB</i> .
1	Non Zero	The drive returns the vital product data of page code requested.

**Allocation Length** specifies the number of bytes that the Initiator has allocated for INQUIRY data to be returned. An allocation length of zero implies that no data is to be returned. The Target will terminate the DATA IN phase when all available INQUIRY data has been transferred or when allocation length bytes have been transferred, whichever is less.

**Note:** If an INQUIRY command is received from an Initiator with a pending unit attention condition (before the target reports *Check Condition* status), the Target processes the INQUIRY command. The unit attention condition is not cleared by this action.

**Note:** The INQUIRY command is a Priority command and is not queued.

**Note:** The inquiry data is set at the time of manufacture and will not change (without a FRU change), with the following exceptions:

- Product Revision Level (EVPD=0) can be changed when microcode is downloaded with the Write Buffer command..
- The information returned for EVPD=1, Page Code = 3 is not fixed.

**Note:** The inquiry data returned when media is not available will not be complete.

Byte 0 of the returned data on an INQUIRY command is the same no matter which page(s) is(are) returned. This description is to be used for all the following page definitions.

The Peripheral Qualifier field of zero (0) indicates that the peripheral device is currently connected to this logical unit. A Peripheral Device Type field of zero (0) indicates that this device is a Direct Access Storage Device (DASD).

## 19.5.1 Inquiry Data

Fields with a value shown inside quotes (e.g. Value = 'xyz') are character fields. A value not in quotes is a numeric value. Character fields are alphanumeric and represented in either ASCII.

### 19.5.1.1 Inquiry Data Format - EVPD = 0, Page Code = 0

Table 109: Inquiry Data- EVPD = 0

Byte	BIT							
	7	6	5	4	3	2	1	0
0	Qualifier = 0			Peripheral Device Type = 0				
1	RMB = 0	Reserved=0						
2	Version = 3							
3	Obsolete	Obsolete	Norm ACA=0	HiSup = 1	Response Data Format = 2			
4	Additional Length = 159 (9Fh)							
5	SCCS=0	ACC=0	ALUA=00b		3PC=0	Reserved = 0		Protect=1
6	BQue = 0	EncSer = 1	Port	MultiP=1	MChngr=0	Obsolete		Addr16 = 0
7	Obsolete	Obsolete	Wb_16 =0	Sync = 0	Link = 0	Obsolete	CmdQue=1	RSVD = 0
8-15	Vendor ID = "HITACHI " (ASCII)							
16-31	Product ID (ASCII)							
32-35	Product Revision Level (ASCII)							
36-43	Unit Serial Number (ASCII)							
44-95	Reserved = 0							
96	Hard Assigned ALPA							
97	Acquired ALPA							
98-147	Copyright Notice (ASCII)							
148-163	Reserved=0							

- **Qualifier** is set to zero to indicate that the LUN specified is currently supported. Qualifier is set to 011b when the LUN specified is not present <sup>1</sup>
- **Peripheral Device Type** is set to zero to indicate that the device is a Direct-Access Peripheral Device.
- **Removal Media Bit (RMB)** is always set to zero to indicate no removal media exists.
- **Version** indicates the level of the ANSI standard that the product supports. The drive supports ANSI SCSI version 3.
- **NormACA** (Normal ACA) field of 0 indicates the device server does not support setting the NACA bit to one in the Control Byte of the CDB as defined in the SAM.
- **HiSup** bit of 1 indicates that the drive uses the hierarchical addressing model to assign LUNs to logical units.

<sup>1</sup>. If an INVALID LUN is specified, a *Check Condition* status will be returned for all commands except INQUIRY and REQUEST SENSE.

- **Response Data Format** is set to two to indicate that the INQUIRY Data Format as specified in the ANSI SCSI version 2 is supported by the Target.
- **Additional Length** indicates the number of bytes of INQUIRY information that follows.
- **SCCS** bit of zero indicates that the device does not contain an embedded storage array controller component.
- **ACC** bit of zero indicates that no access controls coordinator may be addressed through this logical unit.
- **ALUA** bit of zero indicates that the device does not support asymmetric logical unit access.
- **3PC** bit of zero indicates that the device does not support third-party copy commands.
- **Protect** bit of one indicates that the drive supports protection information
- **BQue** bit shall be zero if the CmdQue bit is one.
- **EncSer** (Enclosure Services) bit of 0 indicates that the Target does not contain an embedded enclosure services component..
- **Port** bit of 0 indicates that the drive received the Inquiry command on port A, while a Port bit of 1 indicates that the drive received the Inquiry command on port B.
- **MultiP** (MultiPort) bit of 1 indicates that the Target has multiple ports and implements multi-port requirements.
- **MChngr** (Medium Changer) bit is always 0 to indicate MChngr is not supported.
- **Addr16** (Wide SCSI Address 16) bit of 0 indicates that the Target does not support 16-bit wide SCSI Addresses.
- **Wb\_16** is set to zero to indicate that the Target does not support 16-bit wide data transfers.
- **Sync** is set to zero to indicate that the Target does not support synchronous data transfer.
- **Link** is set to zero to indicate that the Target does not support linked commands.
- **CmdQue** is set to one to indicate that the drive supports command queuing.
- **Vendor ID** is HITACHI padded with ASCII blanks.
- **Product ID** is specified in table 3 of Section 4.3.1.
- **Product Revision Level** indicates the level of microcode.
- **Unit Serial Number** contains the drive serial number.
- **Hard Assigned ALPA** contains the hard Arbitrated Loop Physical Address of the port which received the Inquiry command.
- **Acquired ALPA** contains the Arbitrated Loop Physical Address acquired by the port which received the Inquiry command.

### 19.5.1.2 Inquiry Data Format - EVPD = 1 - Page Code = 00h

Table 110: Inquiry Data - EVPD = 1 (Page Code = 00h)

Byte	BIT							
	7	6	5	4	3	2	1	0
0	Qualifier = 0			Peripheral Device Type = 0				
1	Page Code = 00h							
2	Reserved = 0							
3	Page Length = 09h							
4	Supported Page Code - 00h							
5	Supported Page Code - 03h							
6	Supported Page Code - 80h							
7	Supported Page Code - 83h							
8	Supported Page Code = 86h							
9	Supported Page Code = 87h							
10	Supported Page Code = 88h							
11	Supported Page Code - D1h							
12	Supported Page Code - D2h							

- **Qualifier** is set to zero to indicate that the LUN specified in the Command Block is currently supported.
- **Peripheral Device Type** is set to zero to indicate that the device is Direct Access.
- **Page Code** is set to 0, and this field contains the same value as in the page code field of the INQUIRY command descriptor block.
- **Page length** specifies the length of the following page data.
- **Supported Page Code** field contains the Page Codes supported by the Target. The list is in ascending order.

### 19.5.1.3 Inquiry Data Format - EVPD = 1, Page Code - 03h

Table 111: Inquiry Data - EVPD = 1 (Page Code = 03h)

Byte	BIT							
	7	6	5	4	3	2	1	0
0	Qualifier = 0			Peripheral Device Type = 0				
1	Page Code = 03h							
2	Reserved = 0							
3	Page Length = 184 (B8h)							
4	ASCII Fields Length = 00h							
5-7	Reserved = 0							
8-23	Reserved = 0							
24-35	ASCII uCode Identifier							
36-39	ASCII Servo P/N							
40-41	Major Version							
42-43	Minor Version							
44-47	User Count							
48-51	Build Number							
52-79	Build Date String							
80-81	Code ID							
82-83	Compatibility ID							
84-91	Product ID							
92-99	Interface ID							
100-107	Code Type							
108-119	User Name							
120-135	Machine Name							
136-167	Directory Name							
168-171	Operating State							
172-175	Functional Mode							
176-179	Degraded Reason							
180-183	Broken Reason							
184-187	Code Mode							

- **Qualifier** is set to zero to indicate that the LUN specified in the Command Block is currently supported.
- **Peripheral Device Type** is set to zero to indicate that the device is Direct Access.

- **Page Code** is set to the value of the page code field in the CDB.
- **Page Length** field specifies the length (in bytes) of the vendor unique VPD information (bytes 4 - 163). If the allocation length of the CDB is too small to transfer all the data, the Page Length field is not adjusted to reflect the truncation.
- **ASCII uCode Identifier** contains the drive's microcode identifier. The field is alphanumeric (ASCII), left aligned, and the unused bytes are ASCII spaces (20h).
- **ASCII Servo P/N** contains the part number of the Servo microcode installed on the drive. This field is hex numeric ASCII (i.e., the characters will be in the set 0...9, A...F).
- **Major Version** and **Minor Version** are version numbers of the code loaded on the drive.
- **User Count** is the number of times the code has been built since the master build.
- **Build Number** is the master build version number.
- **Build Date String** is the date the code on the drive was built, in an extended string format.
- **Code ID** is a binary value for firmware development tracking.
- **Compatibility ID** is a binary value for firmware development tracking.
- **Product ID** is the name of the product this code is for.
- **Interface ID** is the interface type and serial interface speed (e.g. SCSI or FCAL 4Gb) of the code.
- **Code Type** is the intended use of the this code. (e.g. local, released, test)
- **User Name** is the username of the person who built this version of the code.
- **Machine Name** is the workstation on which this version of the code was built.
- **Directory Name** is the last 32 characters of the directory from where this code was built.
- **Operating State** is the drive operating state. The least significant bit contains the following:
 

0 = OM_BROKEN	We have detected a hardware failure.
1 = OM_DEGRADED	We have a soft failure; i.e., incomplete format. Motor is still spinning.
2 = OM_INACCESSIBLE	Drive is good but motor is stopped.
3 = OM_STARTING	Motor is starting.
4 = OM_SPINNING	Motor is started but reserved area is not loaded yet.
5 = OM_NORMAL	Drive is spinning and ready to read/write.
6 = OM_SLEEP	Drive is ready but has entered power save mode.
7 = OM_STOPPED	Drive has come ready but now has been stopped.
- **Functional Mode** is the drive functional mode. The least significant byte (0x0000000n) contains the following:
 

0 = OM_NORMAL_MODE	Not in special or recovery mode.
1 = OM_SPECIAL_CMD	Special command mode on.
3 = OM_SPC_RSV_ACCESS	Special cmd mode and access to reserved area allowed.
5 = OM_SPC_SDWNLOAD	Special cmd mode and special download allowed.
7 = OM_SPC_RACCESS_SDWNLD	Special cmd, access to reserved area, and special download allowed.

 The second byte (0x000n0000) contains the following:
 

0 = Idle functions are not enabled.	
1 = Idle functions are enabled.	
- **Degraded Reason** (UECType) is why the file is in a degraded mode; i.e., how to exit this mode.
- **Broken Reason** (UECType) is why the drive believes the hardware is broken.
- **Code Mode** is the type of code the drive is running. The least significant bit contains the following:
 

- 0 = OM_FLASH	Drive is running flash code
- 1 = OM_FLASH_OVERLAY	Drive is running flash overlay code
- 2 = OM_DISK	Drive is running code that has been loaded from disk
- 3 = OM_TRANSIENT	Drive is running code that has been downloaded but not saved

### 19.5.1.4 Inquiry Data Format - EVPD = 1, Page Code - 80h

Table 112: Inquiry Data - EVPD = 1 (Page Code = 80h)

Byte	BIT							
	7	6	5	4	3	2	1	0
0	Qualifier = 0			Peripheral Device Type = 0				
1	Page Code = 80h							
2	Reserved = 0							
3	Page Length = 16 (10h)							
4-19	Serial Number (ASCII)							

- **Qualifier** is set to zero to indicate that the LUN specified in the Command Block is currently supported.
- **Peripheral Device Type** is set to zero to indicate that the device is Direct Access.
- **Page Code** is set to the value of the page code field in the CDB.
- **Page Length** is set to 16, and this field specifies the length of the following page data.
- **Serial Number** gives the drive serial number, right aligned.

### 19.5.1.5 Inquiry Data - EVPD = 1 (Page Code = 83h)

Table 113: Inquiry Data - EVPD = 1 (Page Code = 83h)

Byte	BIT							
	7	6	5	4	3	2	1	0
0	Qualifier = 0			Peripheral Device Type = 0				
1	Page Code = 83h							
2	Reserved = 0							
3	Page Length = 12 (0Ch)							
4	Reserved = 0				Code Set = 1			
5	Reserved = 0		Association = 0		Identifier Type = 3			
6	Reserved = 0							
7	Identifier Length = 8							
8-15	(MSB) World Wide ID							(LSB)

- **Qualifier** is set to zero to indicate that the LUN specified in the Command Block is currently supported.
- **Peripheral Device Type** is set to zero to indicate that the device is Direct Access.
- **Page Code** is set to the value of the page code field in the CDB.
- **Page Length** is set to 12, and this field specifies the length of the following page data.
- **Code Set** field specifies the code set used for the identifier field. The Target supports binary.
- **Association** field is set to 0, indicating that the Identifier field is associated with the logical unit.
- **Identifier Type** field specifies the format and assignment authority for the identifier. The Target supports the value of 03h.
- **World Wide ID** is a 64-bit unique value for each drive. The format is: **5000CCAh xxxh nb yyb** where:
  - xxx** is the 12-bit Block Assignment defined for each model and manufacturing site
  - n** is the 22-bit drive unique serial number representation
  - yy** is the 2-bit Port Identifier

### 19.5.1.6 Inquiry Data Format - EVPD = 1, Page Code - 86h

Byte	BIT							
	7	6	5	4	3	2	1	0
0	Qualifier = 0			Peripheral Device Type = 0				
1	Page Code = 86h							
2	Reserved = 0							
3	Page Length = 60 (3Ch)							
4	Reserved = 0				RTO	GRD_CHK	APP_CHK	REF_CHK
5	Reserved = 0			Group_Sup	Prior_Sup	HEADSUP	ORDSUP	SIMPSUP
6	Reserved=0					NV_SUP	V_SUP	
7-63	Reserved = 0							

- **RTO (Reference Tag Ownership)** is set to one to indicate that the drive supports application client ownership of the

Logical Block Reference Tag field.

- **GRD\_CHK (Guard Check)** is set to one to indicate that the drive checks the Logical Block Guard Tag field in the protection information, if any.
- **APP\_CHK (Application Tag Check)** bit is set to one to indicate that the drive checks the Logical Block Application Tag field in the protection information, if any.
- **REF\_CHK (Reference Tag Check)** bit is set to one to indicate that the drive checks the Logical Block Reference Tag field in the protection information, if any.
- **GROUP\_SUP (Group Supported)** bit is set to zero to indicate that the grouping function is not supported.
- **PRIOR\_SUP (Priority Supported)** bit is set to zero to indicate that task priority is not supported.
- **HEADSUP (Head of Queue Supported)**, **ORDSUP (Ordered Supported)**, and **SIMPSUP (Simple Supported)** are set to one to indicate support for Head of Queue, Ordered and Simple task attributes.
- **NV\_SUP (Non-volatile Supported)** is set to 0 to indicated that non-volatile cache features are not supported.
- **V\_SUP (Volatile Supported)** is set to 1 to indicated support of a volatile cache.

### 19.5.1.7 Inquiry Data Format - EVPD = 1, Page Code - 87h

Byte	BIT							
	7	6	5	4	3	2	1	0
0	Qualifier = 0			Peripheral Device Type = 0				
1	Page Code = 87h							
2-3	Page Length = 0004h							
4	Reserved=0		Policy Page Code = 3Fh					
5	Policy Subpage Code = FFh							
6	MILUS=1	Reserved = 0					Mode PagePolicy = 0	
7	Reserved = 0							

- **Policy Page Code** set to 3Fh and **Policy Subpage Code** set to FFh indicate that the descriptor applies to all mode pages and subpages
- **MILUS (Multiple Logical Units Share)** set to one indicates the policy is shared by multiple logical units.
- **Mode Page Policy** set to 00b indicates that all mode pages and subpages are shared.

### 19.5.1.8 Inquiry Data Format - EVPD = 1, Page Code - 88h

Byte	BIT							
	7	6	5	4	3	2	1	0
0	Qualifier = 0			Peripheral Device Type = 0				
1	Page Code = 88h							
2-3	Page Length = 48 (0030h)							
4-5	Reserved=0							
6-7	Primary Relative Port = 0001h							

8-9	Reserved = 0				
10-11	Initiator Port Transport ID Length = 0				
12-13	Reserved = 0				
14-15	Primary Target Port Descriptors Length = 0Ch				
16	Protocol Identifier			Code Set = 1	
17	PIV=1	RSVD	Association = 1	Identifier Type = 3	
18	Reserved = 0				
19	Identifier Length = 8				
20-27	(MSB)	Primary Target Port Identifier (World Wide ID)			(LSB)
28-29	Reserved = 0				
30-31	Secondary Relative Port = 0002h				
32-33	Reserved = 0				
34-35	Initiator Port Transport ID Length = 0				
36-37	Reserved = 0				
38-39	Secondary Target Port Descriptors Length = 0Ch				
40	Protocol Identifier			Code Set = 1	
41	PIV=1	RSVD	Association = 1	Identifier Type = 3	
42	Reserved = 0				
43	Identifier Length = 8				
44-51	(MSB)	Secondary Target Port Identifier (World Wide ID)			(LSB)

- **Protocol Identifier** is valid only when PIV=1. Protocol Identifier = 0 indicates Fibre Channel devices. Protocol Identifier = 6 indicates SAS devices
- **Code Set** specifies the data type for the identifier field. Code Set = 1 indicates binary data
- **PIV (Protocol Identifier Valid)** set to one indicates that the Protocol Identifier field contains a valid value.
- **Association** specifies the entity with which the Identifier field is associated: 1h for Target or Relative Port.
- **Identifier Type** specifies the format and assignment authority for the identifier: 3h indicates NAA format of the WWID for Target Port.
- **Identifier** fields contain the actual Identifier Descriptor.
  - The Target Port Identifiers are defined in the NAA IEE WWID format where:

World Wide ID is a World Wide ID is a 64-bit unique identification for each drive. The format is: 5000CCAh xxxh yyb n where xxx is the 12-bit block assignment defined for each model and manufacturing site yy is the 2-bit port/node ID select n is the 22-bit drive unique serial number.

### 19.5.1.9 Inquiry Data Format - EVPD = 1, Page Code - D1h

Table 114: Inquiry Data - EVPD = 1 (Page Code = D1h)

Byte	BIT							
	7	6	5	4	3	2	1	0
0	Qualifier = 0			Peripheral Device Type = 0				
1	Page Code = D1h							
2	Reserved = 0							
3	Page Length = 80 (50h)							
4-19	ASCII Media Disk Definition							
20-35	ASCII Motor Serial Number							
36-51	ASCII Flex Assembly Serial Number							
52-67	ASCII Actuator Serial Number							
68-83	ASCII Device Enclosure Serial Number							

- **Qualifier** is set to zero to indicate that the LUN specified in the Command Block is currently supported.
- **Peripheral Device Type** is set to zero to indicate that the device is Direct Access.
- **Page Code** is set to the value of the page code field in the CDB.
- **Page Length** is set to 80, and this field specifies the length of the following page data.

**Note:** If the media is not available, bytes 0 through 3 are valid. All the other fields are ASCII blanks (20h).

**Note:** All ASCII fields are alphanumeric, left aligned, and padded on the right with ASCII blanks (20h).

### 19.5.1.10 Inquiry Data Format - EVPD = 1, Page Code - D2h

Table 115: Inquiry Data - EVPD = 1 (Page Code = D2h)

Byte	BIT							
	7	6	5	4	3	2	1	0
0	Qualifier = 0			Peripheral Device Type = 0				
1	Page Code = D2h							
2	Reserved = 0							
3	Page Length = 52 (34h)							
4	HDC Version Length = 16 (10h)							
5 - 20	ASCII HDC Version							
21	Card Serial Number Length = 16 (10h)							
22 - 37	ASCII Card Serial Number							
38	Card Assembly Part Number Length = 16 (10h)							
39 - 54	ASCII Card Assembly Part Number							
55	Reserved = 0							

- **Qualifier** is set to zero to indicate that the LUN specified in the Command Block is currently supported.
- **Peripheral Device Type** is set to zero to indicate that the device is Direct Access.
- **Page Code** is set to the value of the page code field in the CDB.
- **Page Length** is set to 52, and this field specifies the length of the following page data.

**Note:** If the media is not available, bytes 0 through 3 are valid. All the other fields are ASCII blanks (20h).

**Note:** All ASCII fields are alphanumeric, left aligned, and padded on the right with ASCII blanks (20h).

## 19.6 LOG SELECT (4C)

Table 116: Log Select (4C)

Byte	Bit							
	7	6	5	4	3	2	1	0
0	Command Code = 4Ch							
1	Reserved = 0			Reserved = 0			PCR	SP
2	PC		Reserved = 0					
3	Reserved = 0							
4								
5								
6								
7	(MSB) Parameter List Length = 0							(LSB)
8								
9	Reserved = 0					FLAG	LINK	

The LOG SELECT command provides a means for the Initiator to clear statistical information maintained by the drive and reported via the LOG SENSE command.

- **PCR** The Parameter Code Reset determines whether the Log Sense parameters will be cleared and unit attention posted for all other Initiators. A value of 1 indicates that the parameters be cleared, while a value of zero (except when PC = 11b) indicates that the parameters not be cleared. Parameter list length must be zero when PCR is 1. The PC field is ignored for list parameters, i.e. when the Format and Linking (F&L) field contains 01b or 11b.
- **SP** The Save Parameters bit value of zero indicates that the page parameters not be saved. A value of 1 indicates that the page parameters that are savable be saved after they have been changed. SP bit MUST be 1 if parameter list length is greater than zero. Otherwise it will result in a *Check Condition* status being returned. The sense key shall be set to *Illegal Request* and additional sense code of *Invalid Field in CDB*.
- **PC** The Page Control field defines the type of parameters to be selected. The PC field set to 11b (and PCR is then a don't care) indicates that the Default Cumulative values are set to their default values of 0. If the PC field is set to 01b and PCR is set to 1, the Current Cumulative values are also set to their default values of 0.

Parameter List Length MUST be zero when PC = 11b. Otherwise the command is terminated and a *Check Condition* status is returned. The sense key shall be set to *Illegal Request* and additional sense code of *Invalid Field in CDB*.

- **Parameter List Length** The Parameter List Length field specifies the length in bytes of the parameter list that shall be located in the DATA OUT buffer. A parameter list length zero indicates that no pages shall be transferred.

**Note:** A specified length greater than 0x00FF will result in a *Check Condition* status being returned. A length that results in log data being truncated will generate a *Check Condition* status.

**Note:** For page 0Fh, the maximum parameter list length supported is 4004h (4 bytes for the header and 100h bytes for each of the 40h parameters that are supported). The Parameter List Length must be an integral of the number of parameters plus the 4 byte header. (Ex: Parameter length =104h for one parameter, 204h for 2 parameters,... 4004h for all 40h parameters).

The drive allows updates to the current cumulative values only. A value of zero is acceptable and is not considered an error. The drive updates only pages 0Eh, the Start/Stop Cycle page and 0Fh, the Application Client page. For other pages the parameters are ignored. If the data out buffer contains multiple pages then the application client should send the pages in ascending order. If the data out buffer contains multiple log parameters within a page, all log parameters within the page should be sent

and they should be sent in ascending order by parameter code value. The drive shall return Check Condition status if the application client sends pages out of order, parameter codes out of order or missing parameter code. The sense key shall be set to Illegal Request and additional sense code set to Invalid Field in Parameter List. If one or more fields of the CDB are not set correctly the command will be terminated with a *Check Condition* status. The sense key shall be set to *Illegal Request* and additional sense code of *Invalid Field in CDB*. To indicate that parameters have changed, the Target generates a unit attention condition for all Initiators except the one that issued the LOG SELECT command.

The following list contains all individual page parameters (counters) that are set to their default value of zero by the LOG SELECT command (when PCR=1).

- Page **02h** parameters: (Counters for write errors)
  - Write errors recovered without delay
  - LBAs with write fault error
  - LBAs with ID type error
  - Total errors recovered
  - Number of times recovery invoked
  - Total write byte count
  - LBAs with hard error
- Page **03h** parameters: (Counters for read errors)
  - Read errors recovered without delay
  - LBAs with ECC detected error
  - LBAs with ID type error
  - Total errors recovered
  - Number of times recovery invoked
  - Total read byte count
  - LBAs with hard error.
- Page **05h** parameters: (Counters for Verify Errors)
  - Errors recovered without delay
  - LBAs with ECC detected error
  - LBAs with ID type error
  - Total errors recovered
  - Number of times recovery invoked
  - Total bytes verified
  - LBAs with hard error.
- Page **06h** parameters: (Counters for non medium errors, seek and other hardware type failures)
  - Non-Medium Error Counter
- Page **15h** parameters: (Background Medium Scan information)
  - BMS Status parameter
  - all Medium Scan parameters

- Page **30h** parameters:
  - Zero Seeks counter
  - Seeks  $\geq$  to 2/3 counter
  - Seeks  $\geq$  1/3 and  $<$  2/3 counter
  - Seeks  $\geq$  1/6 and  $<$  1/3 counter
  - Seeks  $\geq$  1/12 and  $<$  1/6 counter
  - Seeks  $>$  0 and  $<$  1/12 counter
  - Overrun Counter
  - Under run Counter
  - Device Cache Full Read Hits
  - Device Cache Partial Read Hits
  - Device Cache Write Hits
  - Device Cache Fast Writes
  - Device Cache Misses on Reads
- Page **37h** parameters:
  - Media PFA
  - Hardware PFA
  - Total Read Commands
  - Total Write Commands

## 19.7 LOG SENSE (4D)

Table 117: Log Sense (4D)

Byte	Bit							
	7	6	5	4	3	2	1	0
0	Command Code = 4Dh							
1	Reserved = 0			Reserved = 0			PPC=0	SP
2	PC		Page Code					
3	Reserved = 0							
4								
5	(MSB) Parameter Pointer = 0 (LSB)							
6								
7	(MSB) Allocation Length (LSB)							
8								
9	Reserved = 0					FLAG	LINK	

The LOG SENSE command allows the Initiator to retrieve the statistical data regarding the drive.

- **PPC** (Parameter Pointer Control) bit must be set to zero. This specifies that the drive start transferring data starting from the field specified in the parameter pointer field for the number of bytes specified by the allocation length. If the PPC bit is set to 1, *Check Condition* status is returned with a sense key of *Illegal Request* and additional sense code of *Invalid Field in CDB*.
- **SP** (Save Parameters) bit set to 0 specifies that the drive does not save any log parameters. If it is set to 1, all page parameters that are savable (those pages denoted by a DS = 0 in the parameter header control byte) are saved.
- **PC** (Page Control) field defines the type of parameters to be selected. This field must be set to 01b to specify the current cumulative values. Any other value in this field will cause the command to end with a *Check Condition* status with a sense key of *Illegal Request* and an additional sense code of *Invalid Field in CDB*.
- **Page Code** field identifies which page is being requested. This field must be set to the values indicated in Page 0. If the Page Code value is invalid a *Check Condition* status is returned with a sense key of *Illegal Request* and additional sense code of *Invalid Field in CDB*.
- **Parameter Pointer Field** specifies the beginning field for the transfer. This field must be set to 0000h. If the Parameter Pointer Field is not zero a *Check Condition* status is returned with a sense key of *Illegal Request* and additional sense code of *Invalid Field in CDB*.
- **Allocation Length** field specifies the maximum number of bytes the Initiator has allocated for returned Log Sense Data. No bytes are transferred if the length is zero. This condition is not considered an error. The Target terminates the Data In phase when all available Log Sense data has been transferred or when the number of bytes equals the allocation length, whichever is less.

## 19.7.1 Log Page parameters

Each log page begins with a 4-byte page header followed by zero or more variable-length log parameters.

### Page header

Page Code field identifies which log page is being transferred.

The Page Length field specifies the length in bytes of the following log parameters.

### Log parameters

Each log parameter begins with a 4-byte parameter header followed by one or more bytes of parameter value data.

The Parameter Code field identifies which log parameter is being transferred for that log page.

The Parameter Control field, the 3rd byte of each parameter header, contains several fields.

- **DU** The Disable Update bit is set to 0 to indicate that the drive updates the log parameter value to reflect events that should be noted by that parameter.
- **TSD** The Target Save Disable bit is set to zero to indicate that the drive provides a Target defined method for saving log parameters.
- **ETC** The enable Threshold Comparison bit is set to 0 to indicate the drive does not perform comparisons between cumulative and any threshold values.
- **TMC** The Threshold Met Criteria field is not valid because this drive does not perform threshold comparisons. This field is set to 0.
- **Format and Linking** The F & L field indicates the type of log parameter and how parameters that reach their maximum value are handled.
  - 00b: Data counter: If any other parameter in this log page reaches its maximum value, then this parameter shall stop incrementing until reinitialized by a Log Select command.
  - 01b: List format ASCII data: No maximum values to handle
  - 10b: Data counter: If another parameter reported in this log page reaches its maximum value, then this parameter shall not stop incrementing. This parameter may be reinitialized by a Log Select command.
  - 11b: List format binary data: No maximum values to handle.

## 19.7.2 Log Sense Page 0

Page 0 indicates the supported log sense pages. This page is used to determine which additional pages an Initiator can request.

**Table 118: Log Sense Page 0**

Byte	Bit							
	7	6	5	4	3	2	1	0
0	Reserved		Page code = 0					
1	Reserved							
2-3	Page Length = 000Dh(Number of Pages Supported)							
4	First supported page 00h							
5	Second supported page 02h							
6	Third supported page 03h							
7	Fourth supported page 05h							
8	Fifth supported page 06h							
9	Sixth supported page 0Dh							
10	Seventh supported page 0Eh							
11	Eighth supported page 0Fh							
12	Ninth supported page 10h							
13	Tenth supported page 15h							
14	Eleventh supported page 2Fh							
15	Twelfth supported Page Code =30h							
16	Thirteenth supported Page Code = 37h							

### 19.7.3 Log Sense Page 2

This page contains counters for write errors.

**Table 119: Log Sense Page 2 (part 1 of 2)**

Byte	Bit							
	7	6	5	4	3	2	1	0
0	Reserved		Page code = 02h					
1	Reserved							
2-3	PageLength = 54h							
4-5	Parameter Code = 0000h							
6	DU = 0	DS = 0	TSD = 0	ETC = 0	TMC = 0		F&L = 00b	
7	Parameter Length = 08h							
8-15	Errors recovered without delay							
16-17	Parameter Code = 0001h							
18	DU = 0	DS = 0	TSD = 0	ETC = 0	TMC = 0		F&L = 00b	
19	Parameter Length = 08h							
20-27	Errors recovered with possible delays							
28-29	Parameter Code = 0002h							
30	DU = 0	DS = 0	TSD = 0	ETC = 0	TMC = 0		F&L = 00b	
31	Parameter Length = 08h							
32-39	Reserved = 0							
40-41	Parameter Code = 0003h							
42	DU = 0	DS = 0	TSD = 0	ETC = 0	TMC = 0		F&L = 00b	
43	Parameter Length = 08h							
44-51	Total errors recovered							
52-53	Parameter Code = 0004h							
54	DU = 0	DS = 0	TSD = 0	ETC = 0	TMC = 0		F&L = 00b	
55	Parameter Length = 08h							
56-63	Times recovery invoked							

**Table 120: Log Sense Page 2 (part 2 of 2)**

Byte	Bit							
	7	6	5	4	3	2	1	0
64-65	Parameter Code = 0005h							

<b>66</b>	<b>DU = 0</b>	<b>DS = 0</b>	<b>TSD = 0</b>	<b>ETC = 0</b>	<b>TMC = 0</b>	<b>F&amp;L = 00b</b>
<b>67</b>	<b>Parameter Length = 08h</b>					
<b>68-75</b>	<b>Total bytes written</b>					
<b>76-77</b>	<b>Parameter Code = 0006h</b>					
<b>78</b>	<b>DU = 0</b>	<b>DS = 0</b>	<b>TSD = 0</b>	<b>ETC = 0</b>	<b>TMC = 0</b>	<b>F&amp;L = 00b</b>
<b>79</b>	<b>Parameter Length = 08h</b>					
<b>80-87</b>	<b>Count of hard errors</b>					

All parameter counts indicate the number of sectors with the specified types of errors, except Times Recovery Invoked, which is a cumulative count of all recovery steps attempted on all sectors written.

## 19.7.4 Log Sense Page 3

This page contains counters for read errors.

**Table 121: Log Sense Page 3 (part 1 of 2)**

Byte	Bit							
	7	6	5	4	3	2	1	0
0	Reserved		Page code = 03h					
1	Reserved							
2-3	PageLength = 54h							
4-5	Parameter Code = 0000h							
6	DU = 0	DS = 0	TSD=0	ETC = 0	TMC = 0		F&L = 00b	
7	Parameter Length = 08h							
8-15	Errors recovered without delay							
16-17	Parameter Code = 0001h							
18	DU = 0	DS = 0	TSD = 0	ETC = 0	TMC = 0		F&L = 00b	
19	Parameter Length = 08h							
20-27	Errors recovered with possible delays							
28-29	Parameter Code = 0002h							
30	DU = 0	DS = 0	TSD=0	ETC = 0	TMC = 0		F&L = 00b	
31	Parameter Length = 08h							
32-39	Reserved = 0							
40-41	Parameter Code = 0003h							
42	DU = 0	DS = 0	TSD=0	ETC = 0	TMC = 0		F&L = 00b	
43	Parameter Length = 08h							
44-51	Total errors recovered							
52-53	Parameter Code = 0004h							
54	DU = 0	DS = 0	TSD=0	ETC = 0	TMC = 0		F&L = 00b	
55	Parameter Length = 08h							
56-63	Times recovery invoked							
64-65	Parameter Code = 0005h							

**Table 122: Log Sense Page 3 (part 2 of 2)**

Byte	Bit							
	7	6	5	4	3	2	1	0

<b>66</b>	<b>DU = 0</b>	<b>DS = 0</b>	<b>TSD = 0</b>	<b>ETC = 0</b>	<b>TMC = 0</b>	<b>F&amp;L = 00b</b>
<b>67</b>	<b>Parameter Length = 08h</b>					
<b>68-75</b>	<b>Total bytes read</b>					
<b>76-77</b>	<b>Parameter Code = 0006h</b>					
<b>78</b>	<b>DU = 0</b>	<b>DS = 0</b>	<b>TSD = 0</b>	<b>ETC = 0</b>	<b>TMC = 0</b>	<b>F&amp;L = 00b</b>
<b>79</b>	<b>Parameter Length = 08h</b>					
<b>80-87</b>	<b>Count of hard errors</b>					

All parameter counts indicate the number of sectors with the specified types of errors, except Times Recovery Invoked, which is a cumulative count of all recovery steps attempted on all sectors read. ECC-on-the-fly correction is not included in any counters.

## 19.7.5 Log Sense Page 5

This page contains counters for verify errors.

**Table 123: Log Sense Page 5 (part 1 of 2)**

Byte	Bit							
	7	6	5	4	3	2	1	0
0	Reserved		Page code = 05h					
1	Reserved							
2-3	PageLength = 54h							
4-5	Parameter Code = 0000h							
6	DU = 0	DS = 0	TSD = 0	ETC = 0	TMC = 0		F&L = 00b	
7	Parameter Length = 08h							
8-15	Errors recovered without delay							
16-17	Parameter Code = 0001h							
18	DU = 0	DS = 0	TSD = 0	ETC = 0	TMC = 0		F&L = 00b	
19	Parameter Length = 08h							
20-27	Errors recovered with possible delays							
28-29	Parameter Code = 0002h							
30	DU = 0	DS = 0	TSD = 0	ETC = 0	TMC = 0		F&L = 00b	
31	Parameter Length = 08h							
32-39	Reserved = 0							
40-41	Parameter Code = 0003h							
42	DU = 0	DS = 0	TSD = 0	ETC = 0	TMC = 0		F&L = 00b	
43	Parameter Length = 08h							
44-51	Total errors recovered							
52-53	Parameter Code = 0004h							
54	DU = 0	DS = 0	TSD = 0	ETC = 0	TMC = 0		F&L = 00b	
55.	Parameter Length = 08h							
56-63	Times recovery invoked							
64-65	Parameter Code = 0005h							

**Table 124: Log Sense Page 5 (part 2 of 2)**

Byte	Bit							
	7	6	5	4	3	2	1	0
66	DU = 0	DS = 0	TSD = 0	ETC = 0	TMC = 0		F&L = 00b	
67	Parameter Length = 08h							
68-75	Total Bytes Verified							
76-77	Parameter Code = 0006h							
78	DU = 0	DS = 0		TSD = 0	TMC = 0		F&L = 00b	
79	Parameter Length = 08h							
80-87	Count of hard errors							

All parameter counts indicate the number of sectors with the specified types of errors, except Times Recovery Invoked, which is a cumulative count of all recovery steps attempted on all sectors verified. ECC-on-the-fly correction is not included in any counters.

## 19.7.6 Log Sense Page 6

This page contains counters for non-medium errors. This includes seek errors and other hardware type failures.

**Table 125: Log Sense Page 6**

Byte	Bit							
	7	6	5	4	3	2	1	0
0	Reserved		Page code = 06h					
1	Reserved							
2-3	PageLength = 0Ch							
4-5	Parameter Code = 00h							
6	DU = 0	DS = 0	TSD = 0	ETC = 0	TMC = 0		F&L = 00b	
7	Parameter Length = 08h							
8-15	Error count							

### 19.7.7 Log Sense Page D

This page contains temperature information.

**Table 126: Log Sense Page D**

Byte	Bit							
	7	6	5	4	3	2	1	0
0	Reserved		Page code = 0Dh					
1	Reserved							
2-3	PageLength = 0Ch							
4-5	Parameter Code = 0000h							
6	DU = 0	DS = 1	TSD = 0	ETC = 0	TMC = 0		F&L = 00b	
7	Parameter Length = 02h							
8	Reserved							
9	Temperature (degrees Celsius)							
10-11	Parameter Code 0001h							
12	DU = 0	DS = 1	TSD = 0	ETC = 0	TMC = 0		F&L = 00b	
13	Parameter Length = 02h							
14	Reserved							
15	Reference Temperature (degrees Celsius)							

## 19.7.8 Log Sense Page E

This page contains the start-stop cycle information.

**Table 127: Log Sense Page E**

Byte	Bit							
	7	6	5	4	3	2	1	0
0	Reserved		Page code = 0Eh					
1	Reserved							
2-3	PageLength = 24h							
4-5	Parameter Code = 0001h							
6	DU=0	DS=1	TSD=0	ETC=0	TMC = 0		F&L = 00b	
7	Parameter Length = 06h							
8-11	Year of Manufacture (4 ASCII characters)							
12-13	Week of Manufacture (2 ASCII characters)							
14-15	Parameter Code 0002h							
16	DU=0	DS=0	TSD=0	ETC=0	TMC = 0		F&L = 00b	
17	Parameter Length = 06h							
18-21	Accounting Date Year (4 ASCII characters)							
22-23	Accounting Date Week (2 ASCII characters)							
24-25	Parameter Code 0003h							
26	DU=0	DS=1	TSD=0	ETC=0	TMC = 0		F&L = 00b	
27	Parameter Length = 04h							
28-31	Specified cycle count over device lifetime							
32-33	Parameter Code 0004h							
34	DU=0	DS=1	TSD=0	ETC=0	TMC = 0		F&L = 00b	
35	Parameter Length = 04h							
36-39	Accumulated start-stop cycles (4 byte binary number)							

The week and year that the device was manufactured shall be set in the parameter field defined by parameter code 0001h. The date of manufacture cannot be saved using the LOG SELECT command. The data is expected in numeric ASCII characters (30-39h) in the form YYYYWW. The accounting date specified by parameter code 0002h is a parameter that can be saved using the LOG SELECT command.

## 19.7.9 Log Sense Page F

This page contains the Application Client Log.

**Table 128: Log Sense Page F**

Byte	Bit							
	7	6	5	4	3	2	1	0
0	Reserved		Page code = 0Fh					
1	Reserved							
2-3	Page length = 4000h							
	Application client log parameter							
4-259	1st application client log parameter							
16132-16387	64th application client log parameter							

The following table describes the application client log parameter structure.

**Table 129: Log Sense Page F, Application Client Log**

Byte	Bit							
	7	6	5	4	3	2	1	0
0-1	Parameter code							
2	DU = 1	DS = 0	TSD = 0	ETC = 0	TMC = 0		F&L = 00b	
3	Parameter length = FCh							
4-	First parameter byte							
255	Last parameter byte							

Parameter code 0000h through 003Fh are supported.

The values stored in the parameter bytes represent data sent to the device in a previous LOG SELECT command.

## 19.7.10 Log Sense Page 10

This page contains self-test results. The results of the 20 most recent self-tests are stored in this Log page.

**Table 130: Log Sense Page 10**

Byte	Bit							
	7	6	5	4	3	2	1	0
0	Reserved		Page code = 10h					
1	Reserved							
2-3	PageLength = 190h							
4-23	1st self-test results log parameter							
384- 403	20th self-test results log parameter							

The following table describes the self-test results log parameter structure

**Table 131: Log Sense Page 10, self-test results**

Byte	Bit								
	7	6	5	4	3	2	1	0	
0-1	Parameter code								
2	DU = 0	DS = 0	TSD = 0	ETC = 0	TMC = 0		F&L = 11b		
3	Parameter Length = 10h								
4	Function Code			RSVD	Self-Test Results Value				
5	Extended Segment Number								
6-7	Timestamp								
8-15	LBA of First Failure								
16	Reserved				Sense Key				
17	Additional Sense Code								
18	Additional Sense Code Qualifier								
19	Vendor specific								

- **Parameter Code** identifies the log parameter for the log page. The parameter code field for the results of the most recent test will be 0001h. The parameter for the next most recent will be 0002h.
- **Function Code** contains the content of the Function Code field in the SEND DIAGNOSTIC command that initiated this self-test.
- **Self-Test Results Value** is described in the table below.

**Table 132: Log Sense Page 10, self-test results**

<b>Value</b>	<b>Description</b>
<b>0h</b>	The self-test routine completed without error.
<b>1h</b>	The background self-test routine was aborted by the initiator using a SEND DIAGNOSTIC command with the Abort Background self-test function.
<b>2h</b>	The self-test routine was aborted by the application client by a Task Management function or a reset.
<b>3h</b>	An unknown error occurred while the Target was executing the self-test routine and the Target was unable to complete the self-test routine.
<b>4h</b>	The self-test completed with a test element that failed and it is not known which test element failed.
<b>5h</b>	The first segment of the self-test failed.
<b>6h</b>	The second segment of the self-test failed.
<b>7h</b>	The third or greater segment of the self-test failed (see the Extended segment number field).
<b>8h-Eh</b>	Reserved.
<b>Fh</b>	The self-test is in progress.

- **Extended Segment Number** This field identifies the number of the segment that failed during self-test. If no segment failed, this field will be 00h.

**Table 133: Log Sense Page 10, Extended Segment Number**

<b>Extended Segment Number</b>	<b>Short Self-Test</b>	<b>Extended Self-Test</b>
<b>1h</b>	<b>Drive Ready Test</b>	
<b>2h</b>	<b>Drive Diagnostics</b>	
<b>3h</b>	<b>SMART</b>	
<b>4h</b>	<b>Low Level Format check</b>	
<b>5h</b>	<b>Physical Head Check</b>	
<b>6h</b>	<b>Random Verify</b>	
<b>7h</b>	- Verify First 300 MB - Verify Last 100 MB	<b>Verify all LBAs</b>
<b>8h</b>	<b>Recheck SMART</b>	

- **Timestamp** This field contains the total accumulated power-on hours of the Target at the time the self-test completed.
- **LBA of first failure** This field contains the LBA of the first logical block address where a self-test error occurred. If no errors occurred during the self-test or the error is not related to a LBA then the field will be FFFFFFFFFFFFFFFFh.
- **Sense Key, Additional Sense Code and Additional Sense Code Qualifier** These fields will contain the additional information relating to the error or exception conditions during self-test.

See Section 19.40 “SEND DIAGNOSTIC (1D)” on page 262, for detailed listing of operations carried out by SEND DIAGNOSTIC command and Power on Diagnostics.

## 19.7.11 Log Sense Page 15

This page contains information about Background Medium Scan operations.

**Table 134: Log Sense Page 15**

Byte	Bit							
	7	6	5	4	3	2	1	0
0	Reserved		Page code = 15h					
1	Reserved							
2-3	Page Length = (19 + 24N -3)							
	Background Medium Scan parameters							
4-19	BMS Status Parameter							
20-43	First Medium Scan Parameter							
	...							
19+24N	Last Medium Scan Parameter							

The following table describes the BMS Status Parameter structure.

Byte	Bit							
	7	6	5	4	3	2	1	0
0-1	Parameter Code = 0000h							
2	DU=0	DS=0	TSD=0	ETC=0	TMC=0		F&L = 11b	
2-3	Page Length = 0Ch							
4-7	Power On Minutes							
8	Reserved = 0							
9	BMS Status							
10-11	Number of Scans Performed							
12-13	Medium Scan Progress							
14-15	Reserved = 0							

- **Power On Minutes** indicates the total power on minutes at the time the log page is requested
- **BMS Status** is described in the following table

BMS Status	Description
00h	No scans active
01h	Background medium scan is active
02h	Background pre-scan is active

BMS Status	Description
03h-04h	Not supported
05h	Background scan halted due to medium formatted without P-List
06h	Background scan halted due to a vendor-specific cause
07h	Background scan halted due to temperature out of range
08h	Scan suspended until BMS Interval Timer expires
09h - FFh	Reserved

- Number of Scans Performed indicates the number of background scans that have been performed over the life of the drive.
- Medium Scan Progress is a percent complete indication of the medium scan. The returned value is a numerator that has 65,536 (1 00 00h) as its denominator.

The following table describes the Medium Scan Parameter structure.

Byte	Bit							
	7	6	5	4	3	2	1	0
0-1	Parameter Code = 0001h - 0800h							
2	DU=0	DS=0	TSD=0	ETC=0	TMC=0		F&L = 11b	
2-3	Page Length = 14h							
4-7	Power On Minutes							
8	Reassign Status				Sense Key			
9	Additional Sense Code							
10	Additional Sense Code Qualifier							
11	Head				(MSB)	Cylinder		
12-13	(MSB)	Cylinder						(LSB)
14-15	(MSB)	Sector						(LSB)
16-23	LBA							

- **Power On Minutes** indicates the total power on minutes at the time the error was detected.
- **Reassign Status** is set as shown below. Reassignment during the background scan is not supported.

Reassign Status	Description
0h	No reassignment needed

Reassign Status	Description
1h	Reassignment pending receipt of Reassign command or write command (if auto write reallocation is allowed) from the initiator
02h-5h	Not supported
6h - Fh	Reserved

**Additional Sense Code and Additional Sense Code Qualifier** provide details about the error detected.

## 19.7.12 Log Sense Page 2F

This page contains SMART Status and Temperature Reading.

**Table 135: Log Sense Page 2F**

Byte	Bit							
	7	6	5	4	3	2	1	0
0	Reserved		Page code = 2Fh					
1	Reserved							
2-3	PageLength = 8							
4-5	Parameter Code = 0000h							
6	DU = 0	DS = 0	TSD = 0	ETC = 0	TMC = 0		F&L = 11b	
7	Parameter Length = 04h							
8	SMART Sense Code Byte							
9	SMART Sense Qualifier							
10	Most Recent Temperature Reading							
11	Vendor HDA Temperature Trip Point							

### 19.7.13 Log Sense Page 30

This page contains Performance Counters.

**Table 136: Log Sense Page 30**

Byte	Bit							
	7	6	5	4	3	2	1	0
0	Reserved		Page code = 30h					
1	Reserved							
2-3	Page Length = 0030h							
4-5	Parameter Code = 0000h							
6	DU = 0	DS = 0	TSD = 0	ETC = 0	TMC = 0		F&L = 00b	
7	Parameter Length = 2Ch							
8-9	Zero Seeks							
10-11	Seeks > = to 2/3							
12-13	Seeks > = 1/3 and < 2/3							
14-15	Seeks > = 1/6 and < 1/3							
16-17	Seeks > = 1/12 and < 1/6							
18-19	Seeks > 0 and < 1/12							
20-23	Reserved = 0							
24-25	Overrun Counter							
26-27	Under run Counter							
28-31	Device Cache Full Read Hits							
32-35	Device Cache Partial Read Hits							
36-39	Device Cache Write Hits							
40-43	Device Cache Fast Writes							
44-47	Device Cache Read Misses							
48-51	Reserved = 0							

Page 30h returns performance counter information. This includes seek counters and buffer overrun/under run counters.

The appropriate seek counter is incremented once during execution of Pre-Fetch, Read, Verify, Write, Write and Verify, Write Same, and Seek commands.

Buffer Overrun conditions are detected during Read commands.

Buffer Underrun conditions are detected during Verify with ByteChk=1, Write, Write and Verify, and Write Same commands.

Only one seek counter is incremented for each of these commands and the counter is incremented only once per command. The length of the initial seek that is required to access the first Logical Block specified for the SCSI command determines which seek counter is incremented. The Zero Seek counter is incremented if a seek is not required or if only a head switch is

required to access the first Logical Block. After the initial seek, no further counter incrementing is performed for that command.

**Note:** The length of a seek as reported in page 30 may differ from expected results. The reason for this is that the drive executes Idle Time Functions between operations of the drive. The seek operations that occur in Idle Time Functions are not directly entered into page 30 seek counters but they change the length of the following seek. This is because after the Idle Time Function is completed, the heads will not necessarily be in the same position as they were at the completion of the previous command.

A buffer overrun or under run condition occurs when the Initiator does not transfer data to or from the Target data buffer fast enough to keep up with reading or writing the media. The buffer overrun counter is incremented during operations that require a Data In phase when a buffer full condition prevents the continued transfer of data from the media to the data buffer. The buffer under run counter is incremented during operations that require a Data Out phase when a buffer empty condition prevents the start or continuation of a data transfer from the data buffer to the media (or a data transfer from the media for a Verify command with BytChk=1).

Buffer Overrun conditions are detected during the following SCSI commands:

- READ (6)
- READ (10)

Buffer Under Run conditions are detected during the following SCSI commands:

- VERIFY WITH BytChk=1
- VERIFY (16) WITH BytChk=1
- WRITE (6)
- WRITE (10)
- WRITE AND VERIFY
- WRITE AND VERIFY (16)
- WRITE SAME
- WRITE SAME (16)
- **ZERO SEEKS**

The number of times no seek was required. The operation may have resulted in a head switch.

- **SEEKS  $\geq$  2/3 DISK**

The number of seeks equal to or greater than 2/3 of the disk.

- **SEEKS  $\geq$  1/3 AND  $<$  2/3 DISK**

The number of seeks equal to or greater than 1/3 and less than 2/3 of the disk.

- **SEEKS  $\geq$  1/6 AND  $<$  1/3 DISK**

The number of seeks equal to or greater than 1/6 and less than 1/3 of the disk.

- **SEEKS  $\geq$  1/12 AND  $<$  1/6 DISK**

The number of seeks equal to or greater than 1/12 and less than 1/6 of the disk.

- **SEEKS  $>$  0 AND  $<$  1/12 DISK**

The number of seeks less than 1/12 of the disk.

- **OVERRUN COUNTER**

The number of times that data was available to be transferred from the media but the device buffer still contained data that had not been retrieved by the Initiator. Consequently, the disk had to take additional revolutions until the buffer was available to accept data.

- **UNDER RUN COUNTER**

The number of times that the drive was ready to transfer data to its disk (on a write), but its buffer was empty (i.e., had not been filled by the Initiator), thus the disk was forced to take extra revolutions.

- **DEVICE CACHE FULL READ HITS**

The number of times that all of the data requested by the read operation was obtained from the device read or write cache.

- **DEVICE CACHE PARTIAL READ HITS**

The number of times that a portion, but not all, of the data requested by the read operation was obtained from the device read or write cache. A physical operation to the device media was required to obtain the remaining data.

- **DEVICE CACHE WRITE HITS**

The number of times that the data associated with a write operation replaces, or is combined with, existing data in the device write cache, thereby eliminating a write operation.

- **DEVICE CACHE FAST WRITES**

The number of times that space was available in the device write cache for the data associated with a write operation and a response was returned immediately.

- **DEVICE CACHE READ MISSES**

The number of times that none of the data requested by the read operation was obtained from the read cache.

The statistics reported by this page are lost on a self-initiated reset or when the Drive is powered off. Even though the DS field equals zero, the parameters on this page are not savable.

## 19.7.14 Log Sense Page 37

This page contains a series of miscellaneous data counters including information about predictive failure analysis occurrences.

**Table 137: Log Sense Page 37**

Byte	Bit							
	7	6	5	4	3	2	1	0
0	Reserved		Page code = 37h					
1	Reserved							
2-3	Page Length = 0030h (48)							
4-5	Parameter Code = 0000h							
6	DU=0	DS=0	TSD=0	ETC=0	TMC = 0		F&L = 00b	
7	Parameter Length = 2Ch							
8	(MSB)							
-	Power on Hours (hours only)							
11	(LSB)							
12	(MSB)							
-	Total Bytes Read							
19	(LSB)							
20	(MSB)							
-	Total Bytes Written							
27	(LSB)							
28	Max Drive Temp (degrees Celsius)							
29 - 30	(MSB)							
	GList Size							
	(LSB)							
31	Number of PFA Occurrences							
32	MED PFA	HDW PFA	Reserved = 0					
33 - 40	Total Read Commands							
41 - 48	Total Write Commands							
49	Reserved = 0							
50-51	Flash Correction Count							

The **Power on Hours** field specifies the total time the drive has been powered on in hours only.

The **Max. Drive Temperature** field specifies the maximum temperature, in degrees Celsius, the drive has ever reached.

The **Glist Size** field gives the total number of LBAs that have been reassigned on the drive.

The **Number of PFA Occurrences** field gives the number of PFA occurrences during the life of the drive and not the number of PFA events that have been reported. The number of reported PFA events may be less due to the settings of Mode Page 0x1C.

If set, the **Media** and **Hardware PFA** bits indicate that a PFA trip has occurred during the life of the drive. These flags are set during a PFA occurrence that may or may not coincide with the reporting of a PFA event as mentioned above.

**Total Read Commands** counter is incremented for each Read (6) and Read (10) command received.

**Total Write Commands** counter is incremented for each Write (6), Write (10), Write Verify and Write Verify (16) command received.

**Flash Correction Count** is incremented each time ECC correction is applied to data stored in Flash ROM.

## 19.8 MODE SELECT (15)

Table 138: Mode Select (15)

Byte	Bit							
	7	6	5	4	3	2	1	0
0	Command Code = 15h							
1	Reserved = 0		PF=1	Reserved = 0			SP	
2	Reserved = 0							
3								
4	Parameter List Length							
5	VU = 0		Reserved = 0			FLAG	LINK	

The MODE SELECT (15) command provides a means for the Initiator to specify LUN or device parameters to the Target. It also allows an Initiator to specify options the Target uses in error recovery, caching, and formatting.

There is a single set of Mode Page parameters shared by all Initiators.

- **PF** A PF (Page Format) bit value of one indicates that the data sent by the Initiator after the Mode Select Header and the Block Descriptor, if any, complies to the Page Format. The Target ignores this field since it only accepts mode parameters in the Page Format.
- **SP** Save Pages. This indicates
  - 0 The drive shall not save the pages sent during the Data Out phase but will use them for all following commands until the power is removed, a reset is received, or a new MODE SELECT command is received.
  - 1 The drive will save the data in the reserved area of the disk. It will be used for all the following commands until another MODE SELECT command is issued. This information is maintained over a power cycle or reset of the drive.
- **Parameter List Length** This specifies the number of bytes to be sent from the Initiator. A parameter list length of zero suppresses data transfer and is not considered an error.

The MODE SELECT parameter list contains a 4-byte header followed by zero or one block descriptor followed by zero or more pages. The pages that are valid with this command are defined in the addendum under the heading **Mode Select Data**, as they vary with the drive model.

### Application Note

The Initiator should issue a MODE SENSE command requesting all Changeable values (see PCF field in byte two of the CDB in) prior to issuing a MODE SELECT command. This is necessary to find out which pages are implemented by the drive and the length of those pages. In the Pages of the MODE SENSE command the drive will return the number of bytes supported for each Page. The Page Length set by the Initiator in the MODE SELECT command must be the same value as returned by the drive in MODE SENSE Page Length. If not, the drive will return *Check Condition* status with sense key of *Illegal Request*.

**Note:** If an Initiator sends a MODE SELECT command that changes any parameters that apply to other Initiators, the drive shall generate an unit attention condition for all Initiators except for the one that issued the MODE SELECT command. The drive shall set the additional sense code to *Parameters Changed (2Ah)*.

## 19.9 MODE SELECT (55)

Table 139: Mode Select (55)

Byte	Bit								
	7	6	5	4	3	2	1	0	
0	Command Code = 55h								
1	Reserved = 0		PF=1	Reserved = 0			SP		
2-6	Reserved = 0								
7-8	(MSB) Parameter List Length							(LSB)	
9	VU = 0		Reserved = 0			FLAG	LINK		

The MODE SELECT (55) command provides a means for the Initiator to specify LUN or device parameters to the Target. See the MODE SELECT (15) command for a description of the fields in this command.

## 19.10 MODE SENSE (1A)

Table 140: Mode Sense (1A)

Byte	Bit							
	7	6	5	4	3	2	1	0
0	Command Code = 1Ah							
1	Reserved			RSVD	DBD	Reserved = 0		
2	PCF		Page Code					
3	Subpage Code							
4	Allocation Length							
5	VU = 0		Reserved = 0			FLAG	LINK	

The MODE SENSE (1A) command provides a means for the drive to report various device parameters to the Initiator. It is the complement to the MODE SELECT command.

If the **DBD** (Disable Block Descriptor) bit is zero, the Target will return the Block Descriptor. If the DBD bit is set to 1, the Target will not return the Block Descriptor.

**Allocation Length** indicates the maximum number of bytes that the Initiator has set aside for the DATA IN phase. A value of zero is not considered an error. If the allocation length is smaller than the amount available, that portion of the data up to the allocation length will be sent. This may result in only a portion of a multi-byte field being sent.

**Page Control Field:** PCF (Page Control Field) defines the type of Page Parameter values to be returned.

### PCF Meaning

**0 0 Report current values.** The drive returns the current values under which the logical unit is presently configured for the page code specified. The current values returned are

1. Initially following power-up but before the media is accessed, the default values become current. Once the media can be accessed, the saved values are read from the Reserved Area and become current.
2. The parameters set in the last successful MODE SELECT command.
3. The saved values if a MODE SELECT command has not been executed since the last power-on, hard RESET condition, or TARGET RESET message.

Following the completion of start-up, execution of the MODE SELECT command can modify the current values.

**Note:** Those parameters associated with format are not considered current and are not saved until the successful completion of a FORMAT UNIT command.

In addition, the current values take on the saved values after a reset if the parameters were saved. If the Page Code is 3Fh, then all pages implemented by the Target are returned to the Initiator with fields and bit values set to current values.

If the Page Code is not 3Fh, the page defined by the Page Code, if supported by the Target, is returned with fields and bits set to current values.

**Note:** The drive will not process the MODE SELECT command until the completion of spin-up. Therefore, the Initiator cannot modify the current values prior to the saved values being read in.

**0 1 Report changeable value.** The drive returns the changeable values for the page code specified. The page requested is returned containing information that indicates which fields are changeable. All bits of parameters that are changeable shall be set to one. Parameters that are *defined by the drive* shall be set to zero. If any part of a field is changeable, all bits in that field shall be set to one.

**Note:** For a value field such as the buffer ratios of page 2 the bit field will not indicate the range of supported values but rather that the field is supported.

**1 0 Report default value.** The drive returns the default values for the page code specified. The parameters not supported by the drive are set to zero.

**1 1 Report saved value.** The drive returns the saved value for the page code specified.

Saved values are one of the following:

- the values saved as a result of MODE SELECT command
- identical to the default values
- zero when the parameters are not supported

The Page Length byte value of each page returned by the drive indicates up to which fields are supported on that page.

**Page Code:** This field specifies which page or pages to return. Page code usage is defined in the figure below.

**Table 141: Page Code Usage**

Page Code	Description
00h - 1Ch	Return specific page, if supported.
3Fh	Return all supported pages.

If a Page Code of 3Fh is used, MODE SENSE returns the pages in ascending order with one exception. Page 0 is always returned last in response to a MODE SENSE command.

If an unsupported page is selected, the command is terminated with a CHECKT CONDITION status and available sense of ILLEGAL REQUEST/INVALID FIELD IN CDB.

**Subpage Code:** This field specifies the subpage to return, and may be set to a specific page, or to FFh for all supported subpages.

### 19.10.1 Mode Parameter List

The mode parameter list contains a header followed by zero or more block descriptors followed by zero or more variable length pages.

#### 19.10.1.1 Header

The 6-byte command descriptor block header is defined below.

**Table 142: Mode parameter header (6)**

Byte	Bit							
	7	6	5	4	3	2	1	0
0	Mode Data Length							
1	Medium Type = 0							
2	WP=0	Reserved=0		DPOFUA=1	Reserved = 0			
3	Block Descriptor Length (= 0 or 8)							

The 10-byte CDB header is defined below.

**Table 143: Mode parameter header (10)**

Byte	Bit							
	7	6	5	4	3	2	1	0
0 1	<b>Mode Data Length</b> (MSB) (LSB)							
2	<b>Medium Type = 0</b>							
3	<b>WP=0</b>	<b>Reserved=0</b>	<b>DPOFUA =1</b>	<b>Reserved = 0</b>				
4 5	<b>Reserved = 0</b>							
6 7	<b>Block Descriptor Length</b> (MSB) (= 0 or 8) (LSB)							

- **Mode Data Length.** When using the MODE SENSE command, the mode data length field specifies the length in bytes of the following data that is available to be transferred. The mode data length does not include the length byte itself. When using the MODE SELECT command, this field is reserved.
- **Medium Type** field is always set to zero in the drive (Default Medium Type).
- **WP.** When used with the MODE SELECT command, the Write Protect (WP) bit is reserved. When used with the MODE SENSE command, a Write Protect (WP) bit of zero indicates that the medium is write enabled.
- **DPOFUA** bit value of 1 indicates that the Target supports the FUA and DPO bits in the Read and Write Commands.
- **Block Descriptor Length** specifies the length in bytes of the block descriptors. When used with the MODE SELECT command, zero or eight is supported by the drive. When used with the MODE SENSE command, the drive returns eight to indicate that only a single block descriptor is available.

**Note:** DPOFUA is ignored during Mode Select command processing although the SCSI Standard states that it is reserved during Mode Select. Ignoring it allows the Mode Sense Parameter List for the byte containing this bit to be re-used as a Mode Select Parameter List.

### 19.10.1.2 Block Descriptor

**Table 144: Mode Parameter Block Descriptor**

<b>Byte 0</b>	(MSB)
<b>Byte 1</b>	<b>Number of Blocks</b>
<b>Byte 2</b>	
<b>Byte 3</b>	
<b>Byte 4</b>	<b>Density code = 0</b>
<b>Byte 5</b>	(MSB)
<b>Byte 6</b>	<b>Block Length</b>
<b>Byte 7</b>	

The Block descriptor provides formatting information about the Number of Blocks (user addressable) to format at the specified Block Length.

- Number of Blocks

When used with the MODE SELECT command, the **Number of Blocks** field must be

- Zero to indicate not to change available blocks
- 0xFFFFFFFF to indicate all available blocks
- The exact number of blocks in the data area of the drive, which can be obtained with the MODE SENSE
- The number of blocks less than exact one, in order to **CLIP** the number of blocks

Any other value is invalid and causes the command to fail with *Check Condition* status.

When used with the MODE SENSE command, the field contains the exact number of blocks.

- Density Code

- Always 0 for direct access devices.

- Block Length

The Block Length field reflects the number of bytes of user data per sector (not including any protection information). When used with the MODE SELECT command, the **Block length** field must contain the value from 512 to 528 (8 bytes step) or zero. Otherwise the drive will terminate the command with *Check Condition* status.

A FORMAT UNIT command is required to cause these parameters to become current only if the block length parameter is different from the current block length.

When used with the MODE SENSE command, the field is dependent on how the media is currently formatted.

### 19.10.1.3 Page Descriptor

**Table 145: Mode Parameter Page Format**

<b>Byte 0</b>	<b>PS</b>	<b>SPF</b>	<b>Page Code</b>
<b>Byte 1</b>	<b>Page Length</b>		
<b>Byte 2-n</b>	<b>Mode Parameters</b>		

Each mode page contains a page code, a page length, and a set of mode parameters.

When using the MODE SENSE command, a Parameter Savable (PS) bit of one indicates that the mode page can be saved by the drive in the reserved area of the drive. A PS bit of zero indicates that the supported parameters cannot be saved. When using the MODE SELECT command, the PS bit is reserved (zero).

**SPF** (Sub-Page Format) is set to zero to indicate the short page format is used. The bit is set to one to indicate the long format is used, supporting sub-pages. The drive supports the following mode page codes:

**Table 146: Mode Parameter Page Format**

<b>Page</b>	<b>Description</b>	<b>PS</b>
<b>00</b>	<b>Vendor Unique Parameters</b>	<b>1</b>
<b>01</b>	<b>Read-Write Error Recovery Parameters</b>	<b>1</b>
<b>02</b>	<b>Disconnect/Reconnect Control Parameters</b>	<b>1</b>
<b>03</b>	<b>Format Device Parameters</b>	<b>0</b>
<b>04</b>	<b>Rigid Disk Geometry Parameters</b>	<b>0</b>
<b>07</b>	<b>Verify Error Recovery Parameters</b>	<b>1</b>
<b>08</b>	<b>Caching Parameters</b>	<b>1</b>
<b>0A</b>	<b>Control Mode Page</b>	<b>1</b>
<b>0C</b>	<b>Notch Parameters</b>	<b>1</b>
<b>19</b>	<b>Port Control Page</b>	<b>1</b>
<b>1A</b>	<b>Power Control Parameters</b>	<b>1</b>
<b>1C</b>	<b>Informational Exceptions Control</b>	<b>1</b>

The page length field specifies the length in bytes of the mode parameters that follow. If the Initiator does not set this value to the value that is returned for the page by the MODE SENSE command, the drive will terminate the command with *Check Condition* status.

## 19.10.2 Mode Page 00 (Vendor Unique Parameters)

Table 147: Vendor Unique Parameters - Page 00

Byte	Bit								Default	
	7	6	5	4	3	2	1	0		
0	PS	0	Page Code = 00h							80h
1	Page Length = 0Eh								0Eh	
2	Ignored			MRG	Ignored				00h	
3	Ignored	VGMDE	Ignored			RRNDE	Ignored		00h	
4	Ignored								00h	
5	Ignored			FDD	Ignored		CAEN	Ignored		02h
6	IGRA	AVERP	Ignored		OCT (high nibble)					00h
7	Overall Command Timer (low byte)								00h	
8	Ignored								00h	
9	Temperature Threshold								00h	
10	Command Aging Limit (Hi byte)								00h	
11	Command Aging Limit (Low byte)								30h	
12	Read Reporting Threshold								0Ah	
13	Write Reporting Threshold								0Ah	
14	DRRT	Ignored			FFMT	Ignored			00h	
15	Ignored		FCERT	BYPS	HIM	Ignored	Reserved = 0		00h	

Fields marked in the table as 'Ignored' are not used or checked by the drive. They will be initialized to zero but can be set as desired for compatibility with older drives.

- **MRG** (Merge Glist into Plist) bit is set to 1 for merging the Glist entries into the Plist during FORMAT UNIT command.
- **VGMDE** (Veggie Mode) bit set to 1 will cause the drive to execute random self-seeks. To enable this mode, the initiator must perform the mode select to set the bit while the drive is spinning, then Stop Unit, then Start Unit. VGMDE set to 0 disables the self-seeks (normal operation).
- **RRNDE** (Report Recovered Non Data Errors) bit controls the reporting of recovered Non Data Errors when the PER bit is set. If RRNDE is set, recovered Non Data Errors are reported. If the RRNDE bit is not set, then recovered Non Data Errors are not reported.
- **FDD** (Format Degraded Disable) controls the reporting of Format Degraded sense data for Test Unit Ready commands when the drive is in a format degraded state. When the FDD bit is one, Format Degraded sense data will not be reported for a Test Unit Ready command. When the FDD bit is zero, Format Degraded sense data will be reported for Test Unit Ready commands when the drive is in a format degraded state. This bit does not affect the reporting of Format Degraded conditions for any media access commands.
- **CAEN** (Command Aging Enable) When set this bit causes the Command Age Limit timer to be used to avoid commands waiting in the command queue for an indefinite period. When commands have been in the queue for a period of time greater than the timer limit they will be reordered to be executed on a first come first served basis. When this bit is reset, commands are always executed based on the queue reordering rules.

- **IGRA** (Ignore Reassigned LBA) bit works in conjunction with the RC bit (Mode Page 01h, byte 2, bit 4). The main purpose of this bit is to avoid undesirable read processing time delays due to reassigned LBA processing for continuous data availability requirements such as Audio Visual applications. If IGRA is set to one and RC is set to one, out-of-line reassigned LBAs will not be processed. If IGRA is set to one and RC is set to zero, or if IGRA is set to zero, reassigned LBAs will be processed normally.
- **AVERP** (AV ERP Mode) bit is set to one in order to specify maximum retry counts during Read DRP. When AVERP bit is set to one, the maximum retry counts for read operations is specified by Read Retry Count (Mode Page 1 Byte 3). AVERP bit is set to zero to specify that the drive shall process read DRP up to the default maximum retry count when Read Retry Count is set to a non-zero value.
- **OCT** (Overall Command Timer) controls the maximum command execution time, from receipt by the drive until status is returned. If the command is unable to complete in the specified amount of time, it will be aborted with Check Condition status, Aborted Command sense key. The Overall Command Timer does not alter the behavior of the Command Aging Limit or Recovery Time Limit. Each unit of this timer is 50 milliseconds. Setting the value to zero disabled the feature.
- **Temperature Threshold** specifies the threshold value in degrees Celsius for the thermal sensor warning message. A value of 0 selects the default value (85 degrees Celsius).
- **Command Aging Limit** This value controls the maximum time a command should wait in the command queue when the CAEN bit is set. Each unit of this timer is 50 ms.
- **Read Reporting Threshold** specifies the error reporting threshold for recovered data errors during read operations when PER=1.
- **Write Reporting Threshold** specifies the error reporting threshold for recovered data errors during write operations when PER=1.
- **DRRT** (Disable Restore Reassign Target) bit disables the reading and restoration of the target LBA during a Reassign Blocks command. If the DRRT bit is zero, the reassign command attempts to restore the target LBA's data. If the data cannot be restored, the target LBA is reassigned and written with a data pattern of all 00s. If the DRRT bit is one, no attempt is made to restore the target LBA.
- **FFMT** (Fast Format Enable) bit allows the formatting of the drive without any writes to the customer media. All format operations are allowed including changing block sizes and manipulating defects. The drive will operate normally after a fast format with the following caveat: since no data is written to any customer data blocks as a result of a Fast Format operation, there is a possibility that a read attempt to any particular block (without having previously written to that block) will result in an unrecoverable data error. This will most likely happen if the block size is changed as every LBA will contain data of an incorrect length and apparently an incorrect starting point. It is also possible to generate an uncorrectable data error without changing block sizes if the defect list is shortened and previously bad blocks become visible in the customer address space. Of course ALL DATA ON THE DRIVE WILL BE LOST as the result of any format operation and so any attempt to read blocks which have not been written to will result in unpredictable behavior.
- **FCERT** (Format Certification) bit determines whether the certification step will be performed during a Format Unit command. FCERT bit set to 0 disables certification. FCERT bit set to 1 enables the certification step.
- **BYPS** (Bypass) controls the drive's actions following a self-initiated reset. If set, the drive will bypass both ports, and remain bypassed when all reset actions are complete. In this mode, intended for development and qualification use, a power cycle is required to re-establish loop communications. If the BYPS bit is zero, the drive will temporarily bypass both ports during the reset, but enable both when the reset actions are complete. A unit attention condition will be reported to indicate that the self-initiated reset has occurred.
- **HIM** (High Impedance Mode) bit determines how the drive will communicate with an 8067 compliant enclosure. When this bit is set to one, the drive configures its enclosure services bus drivers to be standard open collector outputs. When set to zero, the drive will actively drive the bus lines high, rather than rely on an external pull-up resistor.

### 19.10.3 Mode Page 01 (Read/Write Error Recovery Parameters)

Table 148: Mode Page 01 (Vendor Unique Parameters)

Byte	Bit								Default	
	7	6	5	4	3	2	1	0		
0	PS	0	Page Code = 01h							81h
1	Page Length = 0Ah								0Ah	
2	AWRE	ARRE	TB	RC	EER=0	PER	DTE	DCR	C0h	
3	Read Retry Count								01h	
4	Obsolete = 0								00h	
5	Obsolete = 0								00h	
6	Obsolete = 0								00h	
7	Reserved								00h	
8	Write Retry Count								01h	
9	Reserved								00h	
10	Recovery Time Limit								00h	
11										(MSB)

The Read-Write recovery parameters that will be used during any command that performs a read or write operation to the medium are as follows:

- **AWRE** Automatic Write Reallocation Enabled bit, set to zero indicates that the drive shall not perform automatic reallocation of defective data blocks during write operations. An AWRE bit set to one indicates that the drive shall perform automatic reallocation of defective data blocks during write operations.
- **ARRE** Automatic Read Reallocation Enabled bit, set to zero indicates that the drive shall not perform automatic reallocation of defective data blocks during read operations. ARRE bit set to one indicates that the drive shall perform automatic reallocation of defective data blocks during read operations.
- **TB** Transfer Block bit, set to one indicates that a data block that is not recovered within the recovery limits specified shall be transferred to the Initiator before *Check Condition* status is returned. A TB bit set to zero indicates that such a data block shall not be transferred to the Initiator. Data blocks that can be recovered within the recovery limits are always transferred regardless of the value of the bit.
- **RC** Read Continuous bit, set to one requests the Target to transfer the entire requested length of data without adding delays that would increase or ensure data integrity. This implies that the Target may send erroneous data. This bit has priority over all other error control bits (PER, DTE, DCR, TB). RC set to zero indicates normal interpretation of PER, DTE, DCR, and TB values. The RC bit setting is used by the Target when reporting errors associated with the transfer of the Initiator's data for the Read commands interpretation of PER, DTE, DCR, and TB values. The RC bit applies only to READ commands.

**Note:** The Target implementation of the RC option is to disable error detection of the data fields but continue normal error detection and recovery for errors occurring in the servo field. If a servo field failure occurs, normal DRP could result in considerable recovery action, including proceeding through all levels of DRP.

- **EER** an Enable Early Recovery bit, **must be set to zero**, indicating that the drive shall use an error recovery procedure that minimizes the risk of misdetection or miscorrection during the data transfer. Data shall not be fabricated.

- **PER** a Post Error bit, is set to one to indicate that the drive reports recovered errors.
- **DTE** (Data Terminate on Error) bit set to one specifies that data transfer will be halted when the first recovered error is encountered. PER must be set to one when DTE is set to one. DTE set to zero will cause data transfer to continue when recovered errors are encountered.
- **DCR** a Disable Correction bit, is set to one to indicate that Error Correction Code is not used for data error recovery. A DCR bit of zero indicates that ECC is applied to recover the data.
- **Read Retry Count** sets a limit on the amount of DRP passes in which the Target attempts to recover read errors. A value of zero disables all data recovery procedures. When AVERP bit (Mode Page 0 Byte 6 Bit 6) is zero, a value of non-zero in Read Retry Count enables all steps of DRP. When AVERP bit is one, the number in Read Retry Count sets the maximum retry count of DRP.
- **Write Retry Count** sets a limit on the amount of DRP passes in which the Target attempts to recover write errors. A value of zero disables all data recovery procedures..
- **Recovery Time Limit** indicates the period in 1 millisecond increments for the maximum recovery time of a single LBA. The value must be from 40 ms to 65535 ms (65.5 seconds). The granularity of the timer is 50 ms. If an LBA is not able to be recovered within the limit, a Check Condition will be returned. The Recovery Time Limit will not be applied yo Writes when WCE=1. A value of zero disables the timer.

The following summarizes valid modes of operation. If an illegal mode is set, the MODE SELECT command will complete successfully but the action of the drive when an error occurs is undefined.

**PER DTE DCR TB DESCRIPTION**

- 0 0 0 0** Retries and Error Correction are attempted. Recovered or corrected data (if any) or both are transferred with no *Check Condition* status at the end of the transfer.

  - no err** The transfer length is exhausted.
  - soft err** The transfer length is exhausted. Transferred data includes blocks containing recovered errors.
  - hard err** Data transfer stops when an unrecoverable error is encountered. The unrecoverable block is not transferred to the Initiator. The drive then creates the *Check Condition* status with the appropriate sense key.
  
- 0 0 0 1** Retries and Error Correction are attempted. Recovered or corrected data (if any) or both are transferred with no *Check Condition* status at the end of the transfer.

  - no err** The transfer length is exhausted.
  - soft err** The transfer length is exhausted. Transferred data includes blocks containing recovered errors.
  - hard err** Data transfer stops when an unrecoverable error is encountered. The unrecoverable block is transferred to the Initiator. The drive then creates the *Check Condition* status with the appropriate sense key.
  
- 0 0 1 0** Retries are attempted but no error correction (ECC) is applied. Recovered data (if any) are transferred with no *Check Condition* status at the end of the transfer.

  - no err** The transfer length is exhausted.
  - soft err** The transfer length is exhausted. Transferred data includes blocks containing recovered errors.
  - hard err** Data transfer stops when an unrecoverable error is encountered. The unrecoverable block is not transferred to the Initiator. The drive then creates the *Check Condition* status with the appropriate sense key.
  
- 0 0 1 1** Retries are attempted but no error correction (ECC) is applied. Recovered data (if any) are transferred with no *Check Condition* status at the end of the transfer.

  - no err** The transfer length is exhausted.
  - soft err** The transfer length is exhausted. Transferred data includes blocks containing recovered errors.
  - hard err** Data transfer stops when an unrecoverable error is encountered. The unrecoverable block is transferred to the Initiator. The drive then creates the *Check Condition* status with the appropriate sense key.
  
- 0 1 0 0** Illegal Request-DTE must be zero when PER is zero.
- 0 1 0 1** Illegal Request-DTE must be zero when PER is zero.
- 0 1 1 0** Illegal Request-DTE must be zero when PER is zero.
- 0 1 1 1** Illegal Request-DTE must be zero when PER is zero.
- 1 0 0 0** The highest level error is reported at the end of transfer. Retries and error correction are attempted. Recovered or corrected data (if any) or both are transferred with *Check Condition* status and *Recovered Error* sense key set at the end of the transfer.

  - no err** The transfer length is exhausted.
  - soft err** The transfer length is exhausted. Transferred data includes blocks containing recovered errors. The information byte in the sense data will contain the LBA of the last recovered error.
  - hard err** Data transfer stops when an unrecoverable error is encountered. The unrecoverable block is not transferred to the Initiator. The drive then creates the *Check Condition* status with the appropriate sense key.

- 1 0 0 1** The highest level error is reported at the end of transfer. Retries and error correction are attempted. Recovered or corrected data (if any) or both are transferred with *Check Condition* status and *Recovered Error* sense key set at the end of the transfer.
- no err** The transfer length is exhausted.
  - soft err** The transfer length is exhausted. Transferred data includes blocks containing recovered errors. The information byte in the sense data will contain the LBA of the last recovered error.
  - hard err** Data transfer stops when an unrecoverable error is encountered. The unrecoverable block is transferred to the Initiator. The drive then creates the *Check Condition* status with the appropriate sense key.
- 1 0 1 0** The highest level error is reported at the end of transfer. Retries are attempted but ECC is not applied. Recovered or corrected data (if any) or both are transferred with *Check Condition* status and *Recovered Error* sense key set at the end of the transfer.
- no err** The transfer length is exhausted.
  - soft err** The transfer length is exhausted. Transferred data includes blocks containing recovered errors. The information byte in the sense data will contain the LBA of the last recovered error.
  - hard err** Data transfer stops when an unrecoverable error is encountered. The unrecoverable block is not transferred to the Initiator. The drive then creates the *Check Condition* status with the appropriate sense key.
- 1 0 1 1** The highest level error is reported at the end of transfer. Retries and error correction are attempted. Recovered or corrected data (if any) or both are transferred with *Check Condition* status and *Recovered Error* sense key set at the end of the transfer.
- no err** The transfer length is exhausted.
  - soft err** The transfer stops on the first soft error detected. The information in the sense data shall contain the LBA of the block in error.
  - hard err** Data transfer stops on the unrecoverable error. The unrecoverable error block is not returned to the Initiator. The drive then creates the *Check Condition* status with the appropriate sense key.
- 1 1 0 0** The highest level error is reported at the end of transfer. Retries and error correction are attempted. Recovered or corrected data (if any) or both are transferred with *Check Condition* status and *Recovered Error* sense key set at the end of the transfer.
- no err** The transfer length is exhausted.
  - soft err** The transfer stops on the first soft error detected. The information in the sense data shall contain the LBA of the block in error.
  - hard err** Data transfer stops on the unrecoverable error. The unrecoverable error block is not returned to the Initiator. The drive then creates the *Check Condition* status with the appropriate sense key.
- 1 1 0 1** The highest level error is reported at the end of transfer. Retries and error correction are attempted. Recovered or corrected data (if any) or both are transferred with *Check Condition* status and *Recovered Error* sense key set at the end of the transfer.
- no err** The transfer length is exhausted.
  - soft err** The transfer stops on the first soft error detected. The information in the sense data shall contain the LBA of the block in error.
  - hard err** Data transfer stops on the unrecoverable error. The unrecoverable error block is returned to the Initiator. The drive then creates the *Check Condition* status with the appropriate sense key.

- 1 1 1 0 The highest level error is reported at the end of transfer. Retries are attempted but ECC is not applied. Recovered data are transferred with *Check Condition* status and *Recovered Error* sense key set at the end of the transfer.
- no err** The transfer length is exhausted.
  - soft err** The transfer stops on the first soft error detected. The recovered error block is returned to the initiator. The information in the sense data shall contain the LBA of the block in error.
  - hard err** Data transfer stops on the unrecoverable error. The unrecoverable error block is not returned to the Initiator. The drive then creates the *Check Condition* status with the appropriate sense key.
- 1 1 1 1 The highest level error is reported at the end of transfer. Retries are attempted but ECC in not applied. Recovered or corrected data (if any) or both are transferred with *Check Condition* status and *Recovered Error* sense key set at the end of the transfer.
- no err** The transfer length is exhausted.
  - soft err** The transfer stops on the first soft error detected. The information in the sense data shall contain the LBA of the block in error.
  - hard err** Data transfer stops on the unrecoverable error. The unrecoverable error block is returned to the Initiator. The drive then creates the *Check Condition* status with the appropriate sense key.

## 19.10.4 Mode Page 02 (Disconnect/Reconnect Parameters)

Table 149: Mode Page 02 (Disconnect/Reconnect Parameters)

Byte	Bit								Default
	7	6	5	4	3	2	1	0	
0	PS	0	Page Code = 02h						82h
1	Page Length = 0Eh								0Eh
2	Read Buffer Full Ratio								00h
3	Write Buffer Empty Ratio								00h
4-5	(MSB)	Bus Inactivity Limit = 0						(LSB)	00h
6-7	(MSB)	Disconnect Time Limit = 0						(LSB)	00h
8-9	(MSB)	Connect Time Limit = 0						(LSB)	00h
10-11	(MSB)	Maximum Burst Size						(LSB)	00h
12-15	Reserved = 0								00h

The disconnect/reconnect page provides the Initiator with the means to tune the performance of the Fibre Channel Loop.

The drive uses the disconnect/reconnect parameters to control when it attempts to regain control of the Loop during READ and WRITE commands.

- **Read Buffer Full Ratio** is the numerator of a fraction whose denominator is 256. The fraction indicates how full the drive data buffer should be before attempting to re-arbitrate for the Loop. If the ratio is set to 0h, the target will calculate and use an optimal ratio based on the negotiated transfer rate.
- **Write Buffer Empty Ratio** is the numerator of a fraction whose denominator is 256. The fraction indicates how empty the drive data buffer should be before attempting to re-arbitrate for the Loop. If the ratio is set to 0h, the target will calculate and use an optimal ratio based on the negotiated transfer rate.

Both the Read Buffer Full Ratio and the Write Buffer Empty Ratio pertain to the current active notch. For each active notch as defined in page 0Ch there are separate Read Buffer Full Ratios and Write Buffer Empty Ratios. When the active notch is set to zero, the values are applied in mode page 0Ch across all notches.

- **Maximum Burst Size** is not supported, and any value in this field is ignored.

## 19.10.5 Mode Page 03 (Format Device Parameters)

Table 150: Mode Page 03 (Format Device Parameters)

Byte	Bit								Default	
	7	6	5	4	3	2	1	0		
0	PS	0	Page Code = 03h							03h
1	Page Length = 16h								16h	
2-3	(MSB) Tracks per Zone								xxh	
	(LSB)								xxh	
4-5	(MSB) Alternate Sectors per Zone = 0								00h	
	(LSB)								00h	
6-7	(MSB) Alternate Tracks per Zone = 0								00h	
	(LSB)								00h	
8-9	(MSB) Alternate Tracks per Logical Unit = 0								00h	
	(LSB)								00h	
10-11	(MSB) Sectors Per Track								xxh	
	(LSB)								xxh	
12-13	(MSB) Data Bytes per Physical Sector								xxh	
	(LSB)								xxh	
14-15	(MSB) Interleave = 0001h or 0000h								00h	
	(LSB)								01h	
16-17	(MSB) Track Skew Factor								xxh	
	(LSB)								xxh	
18-19	(MSB) Cylinder Skew Factor								xxh	
	(LSB)								xxh	
20	SSEC	HSEC	RMB	SURF	RESERVED = 0				40h	
21-23	Reserved = 0								00h	

The format device page contains parameters that specify the medium format. This page contains no changeable parameters.

- **Tracks per Zone** specifies the number of tracks within the zone. This field is a function of the active notch.
- **Sectors per Track** specifies the number of physical sectors within each track. This field is a function of the active notch.
- **Data Bytes per Physical Sector** specifies the number of user data bytes per physical sector. The value depends upon the current formatted Block Length.
- **Interleave** value of 1 or 0 is valid. However, the drive will ignore this.
- **Track Skew Factor** indicates the number of physical sectors between the last block of one track and the first block on the next sequential track of the same cylinder. This field is a function of the active notch.
- **Cylinder Skew Factor** indicates the number of physical sectors between the last block of one cylinder and the first block on the next sequential cylinder. This field is a function of the active notch.
- **SSEC = Zero** indicates that the drive does not support soft sector formatting.
- **HSEC = One** indicates that the drive supports hard sector formatting.
- **RMB = Zero** indicates that the media does not support removable Fixed Disk.
- **SURF = Zero** indicates that progressive addresses are assigned to all logical blocks in a cylinder prior to allocating addresses within the next cylinder.

## 19.10.6 Mode Page 04 (Rigid Disk Drive Geometry Parameters)

Table 151: Mode Page 04 (Rigid Disk Drive Geometry Parameters)

Byte	Bit								Default
	7	6	5	4	3	2	1	0	
0	PS	0	Page Code = 04h					04h	
1	Page Length = 16h								16h
2-4	(MSB) Number of Cylinders								xxh
	(LSB)								xxh
5	Number of heads								xxh
6-8	(MSB) Starting Cylinder - Write Precompensation = 0								00h
	(LSB)								00h
9-11	(MSB) Starting Cylinder - Reduced Write Current = 0								00h
	(LSB)								00h
12-13	(MSB) Drive Step Rate = 0 (Not used)								00h
	(LSB)								00h
14-16	(MSB) Landing Zone Cylinder = 0 (Not used)								00h
	(LSB)								00h
17	RESERVED = 0					RPL = 0		00h	
18	Rotational Offset = 0 (Not used)								00h
19	RESERVED = 0								00h
20-21	(MSB) Medium Rotation Rate in RPM								3Ah
	(LSB)								98h
22-23	Reserved = 0								00h

The rigid disk drive geometric page specifies various parameters for the drive.

- **RPL = 0**, Indicates that the drive does not support spindle synchronization.

## 19.10.7 Mode Page 07 (Verify Error Recovery Parameters)

Table 152: Mode Page 07 (Verify Error Recovery Parameters)

Byte	Bit								Default
	7	6	5	4	3	2	1	0	
0	PS	0	Page Code = 07h						87h
1	Page Length = 0Ah								0Ah
2	Reserved = 0				EER=0	PER	DTE	DCR	00h
3	Verify Retry Count								01h
4	Obsolete =0								00h
5 - 9	Reserved = 0								00h
10-11	(MSB)	Verify Recovery Time Limit						(LSB)	00h

The Verify recovery parameters are used by the Target when recovering from and reporting errors associated with the verification of the Initiator's Data for the following commands:

- **VERIFY**
- **WRITE AND VERIFY** - the verify portion of the command only.
- **EER**. This bit is 0 since the Target does not support early recovery.
- **PER**. See below for description of bit values.
- **DTE**. (Data Terminate on Error) bit set to one specifies that data transfer will be halted when the first recovered error is encountered. PER must be set to one when DTE is set to one. DTE set to zero will cause data transfer to continue when recovered errors are encountered.
- **DCR**. See below for description of bit values.

The PER, DTE, and DCR bit settings in mode page 7 override those of mode page 1 during VERIFY and the Verify portion of WRITE AND VERIFY. The following combinations of PER and DCR are valid:

### PER DCR DESCRIPTION

- |   |   |  |
|---|---|--|
| 0 | 0 | Soft errors are not reported. ECC is applied to recover the data.  |
| 1 | 0 | Soft errors are reported. ECC is applied to recover the data.      |
| 0 | 1 | Soft errors are not reported. ECC is not used to recover the data. |
| 1 | 1 | Soft errors are reported. ECC is not used to recover the data.     |
- **Verify Retry Count** sets a limit on the amount of verify recovery procedure (VRP) passes the Target attempts when recovering verify errors. The Verify Retry Count of one causes the Target to attempt up to one VRP pass per command when a medium error occurs during a verify operation. Only values of 0h and 01h are valid. The value of 0h disables all recovery.
  - **Verify Recovery Time Limit** indicates the period in 1 millisecond increments for the maximum recovery time of a single LBA during the verify operation. The value must be from 40 ms to 65535 ms (65.5 seconds). The granularity of the timer is 50 ms. If an LBA is not able to be recovered within the limit, a Check Condition will be returned.

## 19.10.8 Mode Page 08 (Caching Parameters)

Table 153: Page 08 (Caching Parameters)

Byte	Bit								Default
	7	6	5	4	3	2	1	0	
0	PS	0	Page Code = 08h						88h
1	Page Length = 12h								12h
2	IC	ABPF	CAP	DISC	SIZE	WCE	MF	RCD	04h
3	Demand Read Retention Priority				Write Retention Priority				00h
4-5	(MSB) Disable Pre-fetch Transfer Length (LSB)								FFh
6-7	(MSB) Minimum Pre-fetch (LSB)								00h
8-9	(MSB) Maximum Pre-fetch (LSB)								FFh
10-11	Maximum Pre-fetch Ceiling								FFh
12	FSW	LBCSS	DRA	Reserved = 0					00h
13	Number of Cache Segments								08h
14-15	(MSB) Cache Segment Size (LSB)								00h
16	Reserved = 0								00h
17-19	(MSB) Non Cache Segment Size (LSB)								00h

The caching parameters page defines parameters that affect the use of the cache.

- **IC** (Initiator Control) bit of one specifies that the drive will honor the following parameters to control cache segmentation and pre-fetch: SIZE, FSW, LBCSS, Number of Cache Segments, Cache Segment Size. The drive will never pre-fetch less data than specified by ABPF, MF, Demand Read Retention Priority, Write Retention Priority, Disable Pre-fetch Transfer Length, Minimum Pre-fetch, Maximum Pre-fetch, and Maximum Pre-fetch Ceiling, but may pre-fetch more based on internal cache algorithms. When the IC bit is set to zero, all the parameters listed above are ignored, and an internal caching algorithm is used.
- **ABPF** (Abort Pre-fetch) bit of one, with DRA set to zero, causes the drive to abort the pre-fetch upon receipt of a new command. ABPF set to one takes precedence over Minimum Pre-fetch. When ABPF is zero, with DRA set to zero, the termination of any active pre-fetch is dependant upon the other parameters in this page.
- **CAP** (Caching Analysis Permitted) is not supported and is ignored. The IC bit can be used to enable or disable adaptive caching.
- **DISC** (Discontinuity) is not supported and is ignored. Pre-fetch operations will continue across cylinders, within the limits of other caching parameters on this page.
- **SIZE** (Size Enable) bit when set to one indicates that the Cache Segment Size is to be used to control caching segmentation. When SIZE is set to zero, the Initiator requests that the Number of Cache Segments is to be used to control caching segmentation.
- **WCE** (Write Cache Enable) bit when set at zero indicates that the drive must issue *Good* status for WRITE (6) or WRITE (10) command only after successfully writing the data to the media. When the WCE bit is set to one, the drive may issue *Good* status for a WRITE (6) or WRITE (10) command after successfully receiving the data but before writing it to the media. When WCE = 1, the drive operates as if AWRE = 1.

**Note:** When WCE = 1, a SYNCHRONIZE CACHE command must be done to ensure data are written to the media before powering down the Target.

- **MF** (Multiplication Factor) bit determines how the Maximum and Minimum Pre-fetch parameters are interpreted. If this bit is set to zero, the parameters are used as is. If the bit is set to one, the parameters are multiplied by the number of blocks requested in the Read Command.
- **RCD** (Read Cache Disable) bit set at zero indicates that the drive may return some or all of the data requested by a READ (6) or READ (10) command by accessing the data buffer, not the media. An RCD bit set at one indicates that the Target does not return any of the data requested by a READ (6) or READ (10) command by accessing the data buffer. All of the data requested is read from the media instead.
- **Demand Read Retention Priority** sets the retention priority of data requested on a Read command. It may be set as defined below:

Value	Definition
0h	Do not distinguish between requested data and other data
1h	Replace requested data before other data.
Fh	Replace other data before requested data.

where the value is the Demand Read Retention Priority or Write Retention Priority. Requested data is the blocks specified in the Read or Write command. Other data is data in the cache from any other operation such as pre-fetch, read-ahead, etc. If the Read Retention Priority is not set to Fh or if the DPO bit on the Read command is set to one, the requested data is overwritten by read-ahead data.

If the DPO bit is set to zero and the Read Retention Priority is set to Fh, the requested data is not overwritten with read-ahead data. If the requested transfer is larger than the segment, the requested data is overwritten with more requested data and there is no read-ahead

- **Write Retention Priority** sets the retention priority of data provided on a Write command. See the definition of Demand Read Retention Priority above for more details.
- **Disable Pre-fetch Transfer Length** is used to prevent read-ahead after Read commands that are longer than the specified number of blocks. If this parameter is set to zero, a read-ahead is not performed.
- **Minimum Pre-fetch** specifies the minimum number of LBAs that the drive should
- after each READ command. A value of zero indicates that read ahead should be terminated immediately after a new command arrives, except when the new command is on the current head and track.
- **Maximum Pre-fetch** specifies the maximum number of LBAs to read ahead after a Read command.
- **Maximum Pre-fetch Ceiling** specifies the maximum number of blocks the drive should attempt to read ahead. This field is ignored.
- **FSW** (Force Sequential Write) is not supported and is ignored. All logical blocks will be written in sequential order.
- **LBCSS** (Logical Block Cache Segment Size) bit when set to one indicates that the Cache Segment Size field units shall be interpreted as logical blocks. When it is set to zero, the Cache Segment Size field units shall be interpreted as bytes.
- **DRA** (Disable Read Ahead) bit when set to one requests that the Target not read into the buffer any logical block beyond the addressed logical block(s). When it is set at zero, the Target may continue to read logical blocks into the buffer beyond the addressed logical block(s).
- **Number of Cache Segments** field is used to select the number of data buffer cache segments. This parameter is valid only when the SIZE bit is set at zero. It is ignored when SIZE is set at one.
- **Cache Segment Size** field indicates the requested segment size in Bytes or Blocks, depending upon the value of the LBCSS bit. The Cache Segment Size field is valid only when the SIZE bit is one. It is ignored when SIZE is set at zero.
- **Non Cache Segment Size** is not supported and is ignored.

## 19.10.9 Mode Page 0A (Control Mode Page Parameters)

Table 154: Page 0A (Control Mode Page Parameters)

Byte	Bit								Default	
	7	6	5	4	3	2	1	0		
0	PS	0	Page Code = 0Ah							8Ah
1	Page Length = 0Ah								0Ah	
2	TST=0		RSVD=0		D_Sense=0	GLTSD=0	RLEC=0		00h	
3	Queue Algorithm Modifier			Rsvd=0	QErr		DQue		00h	
4	RSVD=0	RAC=0	UA_INTLCK_CTRL=0	SWP=0	Obsolete				00h	
5	ATO	TAS=0	Reserved=0						00h	
6-7	Obsolete=0								00h	
8-9	(MSB) Busy Timeout Period (LSB)								00h	
10-11	(MSB) Extended Self-test Routine Completion Time (LSB)								XXh	

Following are parameter options for Page 0A.

- Queue algorithm modifier** specifies restrictions on the algorithm used for reordering commands that are tagged with the SIMPLE message.
  - 0h : Restricted reordering. The Target shall reorder the actual execution sequence of the queued commands from each Initiator such that data integrity is maintained for that Initiator.
  - 1h : Unrestricted reordering allowed. The Target may reorder the actual execution sequence of the queued commands in any manner it selects. Any data integrity exposures related to command sequence order are explicitly handled by the Initiator through the selection of appropriate commands and queue tag messages.
  - 2h-7h : RESERVED.
  - 8 : Command reordering is disabled
  - 9-Fh : RESERVED
- QErr** (Queue Error Management) The queue error management (QERR) field specifies how the device server shall handle blocked tasks when another task receives a *Check Condition* status.

QERR value	Description
00b	Specifies that all tasks from all Initiators are blocked from execution when a Contingent Alligence (CA condition) is pending. Those blocked tasks are allowed to resume execution in a normal fashion after the CA condition is cleared.
01b	Specifies that all tasks from all Initiators are aborted when the Target returns <i>Check Condition</i> status. A unit attention condition will be generated for each Initiator that had commands in the queue except for the Initiator that received the <i>Check Condition</i> status. The sense key will be set to <i>Unit Attention</i> and the additional sense code will be set to <i>Commands Cleared by Another Initiator</i> .

10b	Reserved
11b	Blocked tasks in the task set belonging to the Initiator to which a <i>Check Condition</i> status is sent shall be aborted when the status is sent.

- **DQue** (Disable Queuing) bit set at zero specifies that tagged queuing shall be enabled if the Target supports tagged queuing. A DQue bit set at one specifies that tagged queuing shall be disabled. Command queuing is always enabled on the drive, therefore this bit is ignored.
- **ATO** (Application Tag Owner) bit set to one specifies that the contents of the Logical Block Application Tag field in the protection information, if any, shall not be modified by the drive. An ATO bit set to zero specifies that the contents of the Logical Block Application Tag field in the protection information, if any, may be modified by the drive. If the ATO bit is set to zero, the drive will ignore the contents of the Logical Block Application Tag field in the protection information.
- **Busy Timeout Period** is not supported and is ignored.
- **Extended Self-test Routine Completion Time** is an advisory parameter that an Initiator may use to determine the time in seconds that the Target requires to complete self-test routine when the Target is not interrupted by an Initiator and no errors occur during execution of the self-test routine.

### 19.10.10 Control Extension Subpage

Table 155: Control Extension Subpage

CByte	Bit								Default
	7	6	5	4	3	2	1	0	
0	PS	SPF=1	Page Code = 0Ah						5Ah
1	Subpage Code = 1								01h
2-3	Page Length = 001Ch								001Ch
4	Reserved = 0				TCMOS	SCSIP	IALUAE	00h	
5	Reserved = 0				Initial Priority				00h
6-31	Reserved = 0								00h

No fields in the Control Extension subpage are currently changeable. The page is supported for compatibility only.

## 19.10.11 Mode Page 0C (Notch Parameters)

Table 156: Page 0C (Notch Parameters)

Byte	Bit								Default	
	7	6	5	4	3	2	1	0		
0	PS	0	Page Code = 0Ch							8Ch
1	Page Length = 16h								16h	
2	ND=1	LPN=0	Reserved = 0							80h
3	Reserved = 0								00h	
4-5	(MSB) Maximum Number of Notches (LSB)								XXh	
									XXh	
6-7	(MSB) Active Notch (LSB)								00h	
									00h	
8-11	(MSB) Starting Boundary (LSB)								XXh	
									XXh	
12-15	(MSB) Ending Boundary (LSB)								XXh	
									XXh	
16-23	(MSB) Pages Notched (LSB)								0000h	
									0000h	
									0000h	
									100Ch	

The notch page contains parameters for direct-access devices that implement a variable number of blocks per cylinder. Each section of the logical unit with a different number of blocks per cylinder is referred as a notch. The only field that is changeable is the **Active Notch** field.

- **ND** = One meaning that this device is a notched drive.
- **LPN** = Zero meaning that the notches are based upon physical parameters of the drive (cylinder #), not logical parameters.
- **Maximum Number of Notches** is the number of notches the drive can support. This value is drive model dependent.
- **Active Notch** indicates to which notch subsequent MODE SELECT/SENSE command parameters pertain. A value of 0 is used for parameter values which apply to all notches. Values from 1 to the maximum value depending on the model specify the notch number, where notch 1 is the outermost notch. Following mode parameters are based on the current active notch:
  - **Mode Page 2**
    - Read Buffer Full Ratio
    - Write Buffer Empty Ratio
  - **Mode Page 3**
    - Alternate Sector per Zone
    - Alternate Track per Zone

- Alternate Track per Logical Unit
- Sector per Track
- Track Skew Factor
- Cylinder Skew Factor
- **Starting Boundary** contains the first physical location of the active notch. The first three bytes are the cylinder number and the last byte is the head. The value sent in this field is ignored.
- **Ending Boundary** contains the last physical location of the active notch. The first three bytes are the cylinder number and the last byte is the head. The value sent in this field is ignored.
- **Pages Notched** is a bit map of the mode page codes that indicates which pages contain parameters that may be different for different notches. The most significant bit of this field corresponds to page code 3Fh and the least significant bit corresponds to page code 00h. If a bit is one, then the corresponding mode page contains parameters that may be different for different notches. If a bit is zero, then the corresponding mode page contains parameters that are constant for all notches.

## 19.10.12 Mode Page 19h (Fibre Channel Port Control Page)

Table 157: Mode Page 19h

Byte	BIT								Default
	7	6	5	4	3	2	1	0	
0	PS	RSVD=0	Page Code = 19h						99h
1	Page Length = 06h								06h
2	Reserved = 0								00h
3	DTFD	PLPB	DDIS	DLM	RHA	ALWLI	DTIPE	DTOLI	00h
4	Reserved = 0								00h
5									00h
6	Reserved = 0					RR_TOV Units			00h
7	Resource Recovery Time Out Value (RR_TOV)								00h

- **DTFD** (Disable Target Fabric Discovery) bit of one indicates that a Target attached by an FC-AL loop shall not recognize the presence of a fabric loop port, FL\_Port, on the loop. The Target shall perform only the private loop functions defined for Targets defined by FC-PLDA. When DTFD bit is zero, the Target attached by an FC-AL loop shall discover FL\_Port if present on the loop and perform the public loop functions defined for Targets by FC-FLA.
- **PLPB** (Prevent Loop Port Bypass) bit of one specifies that the Target ignores all LPB (Loop Port Bypass) and LPE (Loop Port Enable) primitive sequences. The Target's ports always remain in participating mode. A PLPB bit of zero specifies that the Target allow LPB and LPE primitive sequences to control its port bypass circuitry.
- **DDIS** (Disable Discovery) bit of one specifies the Target does not require receipt of Address or Port Discovery in order to resume tasks following loop initialization. When DDIS is zero, the Target will only resume tasks for an Initiator on receipt of an Address or Port Discovery from that Initiator.
- **DLM** (Disable Loop Master) bit of one specifies the Target does not become loop master during loop initialization. When DLM is zero, the Target may become loop master.
- **RHA** (Require Hard Address) bit of one indicates that a Target attached to an FC-AL loop shall only attempt to obtain its hard address available in the SCA-2 SFF-8067 connector or device address jumpers during loop initialization. The Target shall not attempt to obtain an address during the LISA phase of initialization. If there is a conflict for the hard address selection during loop initialization or the Target does not have a valid hard address available, the Target shall enter the non-participating state. If the Target detects loop initialization while in the non-participating state, the Target shall again attempt to get its hard address. If the hard address has not changed from the address obtained in a previous successful loop initialization, the Target shall attempt to obtain the address in the LIFA phase if a valid Fabric login exists or LIPA phase of loop initialization. If the hard address has changed, the Target shall attempt to obtain the new address in the LIHA phase. When the RHA bit is zero, the Target follows the normal initialization procedure, including the possibility of obtaining a soft address during the loop initialization process.
- **ALWLI** (Allow Login Without Loop Initialization) bit of one specifies the Target uses its hard address to accept logins without verifying the address with loop initialization. When ALWLI is zero, the Target is required to obtain an address via the loop initialization procedure before accepting a login.
- **DTIPE** (Disable Target Initiated Port Enable) bit of one specifies the Target waits for a Loop Port Enable primitive with its own hard address before inserting itself onto the loop. When DTIPE is zero, the Target inserts itself onto the loop without waiting for a Loop Port Enable primitive.

- **DTOLI** (Disable Target Originated Loop Initialization) bit of one specifies the Target does not generate the initializing LIP following insertion into the loop. The Target will respond to an initializing LIP, if received. The Target will generate the loop failure LIP if it detects a loop failure at its input and the initializing LIP when the loop failure is corrected. When DTOLI is zero, the Target generates the initializing LIP after it enables a port into a loop.
- **RR\_TOV Units** field indicates the units in which the RR\_TOV is calculated, according to Table 158.

**Table 158: Values for RR\_TOV Units**

Byte 6			Units of measure for RR_TOV
bit 2	bit 1	bit 0	
0	0	0	No timer is specified
0	1	1	0.1 seconds
1	0	1	10 seconds
All other values			Reserved

- **RR\_TOV** (Resource Recovery Time Out Value) field indicates the number of time units specified by the RR\_TOV UNITS field that shall be used by the timer that performs the RR\_TOV timeout functions. The timer accuracy is +/- 0.1 seconds. Changes to RR\_TOV will only affect the usage of the timer for non-authentication situations.

When the RR\_TOV Units are set to no timer, the RR\_TOV value (byte 7) shall be ignored by the Target and a default timeout value of 2.0 seconds shall be used for RR\_TOV.

When the RR\_TOV Units are set to 0.1 seconds the following rules apply:

- a value of 00h will result in an infinite timeout value (no timeout will occur) Note: This will also cause E\_D\_TOV to have an infinite timeout value.
- a value from 01h to 7Eh will result in a timeout duration that is the product of the RR\_TOV value and 0.1 seconds any value from 7Fh to FFh will result in the Target terminating the command with CHECK CONDITION status. The sense key is set to *Illegal Request* and the additional sense code is set to INVALID FIELD in the PARAMETER LIST.

When the RR\_TOV Units are set to 10 seconds, the following rules apply:

- a value of 00h will result in an infinite timeout value (no timeout will occur) Note: This will also cause E\_D\_TOV to have an infinite timeout value.
- a value of 01h will result in a timeout duration that is the product of the RR\_TOV value and 10 seconds
- any value from 02h to FFh will result in the Target terminating the command with CHECK CONDITION status.
- The Sense Key is set to Illegal Request and the Additional Sense Code is set to INVALID FIELD in the PARAMETER LIST.

### 19.10.13 Mode Page 1A (Power Control)

Table 159: Page 1A (Power Control)

Byte	Bit								Default	
	7	6	5	4	3	2	1	0		
0	PS	0	Page Code = 1Ah							9Ah
1	Page Length = 0Ah								0Ah	
2	Reserved = 00h								00h	
3	Reserved = 0					Idle	Standby		00h	
4-7	(MSB)	Idle Condition Timer = 0						(LSB)	00h	
8-11	(MSB)	Standby Condition Timer						(LSB)	00h	

- The value for the **Idle Condition Timer** and the corresponding **Idle** control bit is accepted. Despite this, the drive does not alter the internal power saving algorithms based upon this value.
- **Standby** bit of one indicates that the Target shall use the **Standby Condition Timer** to determine the length of inactivity time to wait before entering the Standby condition. A standby bit of zero indicates that the Target shall not enter the Standby condition.
- **Standby Condition Timer** field indicates the inactivity time in 100 millisecond increments that the Target shall wait before entering the Standby condition. The minimum allowable inactivity time is 60 minutes. Any value less than this is accepted, but will automatically default to 60 minutes.

## 19.10.14 Mode Page 1C (Informational Exceptions Control)

Table 160: Page 1C (Informational Exceptions Control)

Byte	BIT								Default	
	7	6	5	4	3	2	1	0		
0	PS	0	Page Code = 1Ch							9Ch
1	Page Length = 0Ah								0Ah	
2	PERF	RSVD	EBF	EWASC	DEXCPT	TEST	EBACK-ERR	LOGERR	10h	
3	Reserved = 0				Method of Reporting				00h	
4-7	(MSB) Interval Timer (LSB)								00h	
									00h	
									00h	
									00h	
8-11	(MSB) Report Count (LSB)								00h	

- **PERF** (Performance) bit is not supported and is ignored. Informational Exception operations will not cause performance delays.
- **EBF** (Enable Background Function) bit is not supported and is ignored. Background functions are always enabled.
- **EWASC** (Enable Warning ASC) bit of zero indicates that Temperature Warnings will not be reported. An EWASC bit of one allows Temperature Warnings to be reported, if the temperature inside the disk enclosure exceeds the threshold set in Mode Page 00h. The Method of Reporting field controls the reporting method. EWASC is independent of DEXCPT.
- **DEXCPT** (Disable Exception Control) bit of zero indicates information exception operations are enabled. The reporting of information exception conditions when the DEXCPT bit is set to zero is determined from the Method of Reporting field. A DEXCPT bit of one indicates the Target disabled all information exception operations.
- **TEST** bit of one instructs the drive to generate false drive notifications at the next interval time, (as determined by the INTERVAL TIMER field), if the DEXCPT is zero. The Method of Reporting and Report Count would apply. The false drive failure is reported as sense qualifier 5DFFh. The TEST bit of zero instructs the drive to stop generating any false drive notifications.
- **Enable Background Error (EBACKERR)** bit of zero disables reporting of background self-test errors and background scan errors via Information Exceptions Control. An EBACKERR bit of one enables reporting of these background errors. The method of reporting these errors is determined from the MRIE field.
- **LOGERR** (Log Errors) is not used and ignored internally by the Target.

- **Method of Reporting Informational Exceptions** indicates the methods used by the Target to report informational exception conditions.

**Code Description**

- 0h No reporting of informational exception condition:** This method instructs the Target to not report informational exception condition.
- 1h Asynchronous event reporting:** Not supported.
- 2h Generate unit attention:** This method instructs the Target to report informational exception conditions by returning a *Check Condition* status on any command. The sense key is set to *Unit Attention* and the additional sense code indicates the cause of the informational exception condition. The command that has the *Check Condition* is not executed before the informational exception condition is reported.
- 3h Conditionally generate recovered error:** This method instructs the Target to report informational exception conditions, dependent on the value of the PER bit of the error recovery parameters mode page, by returning a *Check Condition* status on any command. The sense key is set to *Recovered Error* and the additional sense code indicates the cause of the informational exception condition. The command that has the *Check Condition* completes without error before any informational exception condition is reported.
- 4h Unconditionally generate recovered error:** This method instructs the Target to report informational exception conditions, regardless of the value of the PER bit of the error recovery parameters mode page, by returning a *Check Condition* status on any command. The sense key is set to *Recovered Error* and the additional sense code indicates the cause of the informational exception condition. The command that has the *Check Condition* completes without error before any informational exception condition is reported.
- 5h Generate no sense:** This method instructs the Target to report informational exception conditions by returning a *Check Condition* status on any command. The sense key is set to *No Sense* and the additional sense code indicates the cause of the informational exception condition. The command that has the *Check Condition* completes without error before any informational exception condition is reported.
- 6h Only report informational exception condition on request:** This method instructs the Target to preserve the informational exception(s) information. To find out about information exception conditions the Application Client polls the Target by issuing an unsolicited *Request Sense* command. The sense key is set to *No Sense* and the additional sense code indicates the cause of the informational exception condition.
- 7h-Fh Reserved.**

- **Interval Timer** field indicates the period in 100 millisecond increments for reporting that an informational exception condition has occurred. The target shall not report informational exception conditions more frequently than the time specified by the Interval Timer field and as soon as possible after the time interval has elapsed. After the informational exception condition has been reported the interval timer is restarted. A value of zero or 0xFFFFFFFF in the Interval Timer field indicates that the target only reports the informational exception condition one time and will override the value set in the Report Count field.
- **Report Count** field indicates the number of times the Target reports an informational exception condition. The Report Count of ZERO indicates no limits on the number of times the Target reports an informational exception condition.

### 19.10.14.1 Background Control (Subpage 01h)

Table 161: Background Control (Subpage 01h)

Byte	BIT								Default	
	7	6	5	4	3	2	1	0		
0	PS	SPF=1	Page Code = 1Ch							DCh
1	Subpage Code = 01h								01h	
2-3	Page Length = 0Ch								000Ch	
4	Reserved = 0					S_L_Full	LOWIR	EN_BMS	01h	
5	Reserved = 0						EN_PS		00h	
6-7	Background Medium Scan Interval Time								00A8h	
8-9	Background Pre-Scan Time Limit								0000h	
10-11	Minimum Idle Time Before Background Scan								0000h	
12-13	Maximum Time To Suspend Background Scan								0000h	
14-15	Reserved = 0								0000h	

- **Suspend On Log Full (S\_L\_FULL)** bit set to zero allows background scans to continue if the results log (Log Sense Page 15h) is full. S\_L\_FULL bit set to one will cause background scans to suspend when the log is full.
- **Log Only When Intervention Required (LOWIR)** bit set to zero allows logging of all medium errors in the results log (Log Sense Page 15h). When the LOWIR bit is set to one, only unrecovered medium errors will be logged.
- **EN\_BMS (Enable Background Medium Scan)** bit set to zero specifies that the background medium scan is disabled. EN\_BMS bit set to one specifies that background medium scan operations are enabled. If a background medium scan is in progress when the EN\_BMS bit is changed from one to zero, then the medium scan shall be suspended until the EN\_BMS bit is set to one, at which time the medium scan shall resume from the suspended location.
- **EN\_PS (Enable Pre-Scan)** bit set to zero specifies that the pre-scan is disabled. If a pre-scan operation is in progress when EN\_PS is changed from a one to a zero, then pre-scan is halted. An EN\_PS bit set to one specifies that a pre-scan operation is started after the next power-on cycle. Once this pre-scan has completed, another pre-scan shall not occur unless the EN\_PS bit is set to zero, then set to one, and another power-on cycle occurs.
- **Background Medium Scan Interval Time** specifies the minimum time, in hours, between the end of one background medium scan operation and the start of the next background medium scan operation. The BMS Interval Time shall occur before the initial background medium scan operation is started.
- **Background Pre-Scan Time Limit** specifies the maximum time, in hours, for a pre-scan operation to complete. If the pre-scan operation does not complete within the specified time, then it is halted. A value of zero specifies an unlimited time limit.
- **Minimum Idle Time Before Background Scan** specifies the minimum time, in milliseconds, that the drive must be idle before resuming a background media scan or pre-scan. A value of zero will be treated as the default value of 1.0 second. Any value less than 100 milliseconds will be treated as 100 milliseconds. The internal timer granularity is 50 milliseconds.
- **Maximum Time To Suspend Background Scan** specifies the maximum time, in milliseconds, that the drive should delay before processing a new command while background scanning is in progress.

## 19.11 MODE SENSE (5A)

Table 162: Mode Sense (5A)

Byte	Bit							
	7	6	5	4	3	2	1	0
0	Command Code = 5Ah							
1	Reserved = 0				DBD	Reserved = 0		
2	PCF		Page Code					
3	Subpage Code							
4-6	Reserved = 0							
7-8	(MSB) Allocation Length (LSB)							
9	VU = 0		Reserved = 0			FLAG	LINK	

The MODE SENSE (5A) command provides a means for the drive to report various device parameters to the Initiator. See the MODE SENSE (1A) command for a description of the fields in this command.

## 19.12 PERSISTENT RESERVE IN (5E)

Table 163: Persistent Reserve In (5E)

Byte	Bit							
	7	6	5	4	3	2	1	0
0	Command Code = 5Eh							
1	Reserved = 0			Service Action				
2-6	Reserved = 0							
7-8	(MSB) Allocation Length							(LSB)
9	VU = 0		Reserved = 0			FLAG	LINK	

The PERSISTENT RESERVE IN command is used to obtain information about persistent reservations and reservation keys that are active within the controller. This command is used in conjunction with the PERSISTENT RESERVE OUT command “PERSISTENT RESERVE OUT (5F)” on page 201.

The **Allocation Length** indicates how much space has been allocated for the returned parameter list. If the length is not sufficient to contain all parameter data, the first portion of the data will be returned. If the remainder of the data is required, the initiator should send a new PERSISTENT RESERVE IN command and an Allocation Length large enough to contain all data.

## 19.12.1 Service Action

The following service action codes are implemented. If a reserved service action code is specified, the drive returns a **Check Condition** status. The sense key is set to *Illegal Request* and the additional sense data is set to *Invalid Field in CDB*.

**Table 164: PERSISTENT RESERVE IN, Service Action Codes**

<b>Code</b>	<b>Name</b>	<b>Descriptions</b>
<b>00h</b>	<b>Read Keys</b>	<b>Reads all registered Reservation Keys</b>
<b>01h</b>	<b>Read Reservations</b>	<b>Reads all current persistent reservations</b>
<b>02h</b>	<b>Report Capabilities</b>	<b>Returns capability information</b>
<b>03h</b>	<b>Read Full Status</b>	<b>Reads complete information about all registrations and the persistent reservation, if any</b>
<b>04h-1Fh</b>	<b>Reserved</b>	<b>Reserved</b>

## 19.12.2 Parameter data for Read Keys

Table 165: PERSISTENT RESERVE IN, parameter data for Read Keys

Byte	Bit							
	7	6	5	4	3	2	1	0
0-3	(MSB) <b>Generation</b> (LSB)							
4-7	(MSB) <b>Additional length (n-7)</b> (LSB)							
8-15	(MSB) <b>First reservation key</b> (LSB)							
	:							
(n-7) - n	(MSB) <b>Last reservation key</b> (LSB)							

**Generation** is a counter that increments when PERSISTENT RESERVE OUT command with “Register” or “Preempt and Clear” completes successfully. Generation is set to 0 as part of the power on reset process and hard reset process.

The **Generation** field contains a 32-bit counter that the Target shall increment every time a PERSISTENT RESERVE OUT command requests a Register, a Clear, a Preempt, or a Preempt and Abort service action. The counter shall not be incremented by a PERSISTENT RESERVE IN command, by a PERSISTENT RESERVE OUT command that performs a Reserve or Release service action, or by a PERSISTENT RESERVE OUT command that is not performed due to an error or reservation conflict. Regardless of the APTPL value the generation value shall be set to 0 as part of the power on reset process.

The **Additional Length** field contains a count of the number of bytes in the reservation key list. If the allocation length specified by the PERSISTENT RESERVE IN command is not sufficient to contain the entire parameter list, then only the bytes from 0 to the maximum allowed allocation length shall be sent to the Initiator. The incremental remaining bytes shall be truncated, although the Additional Length field shall still contain the actual number of bytes in the reservation key list without consideration of any truncation resulting from an insufficient allocation length. This shall not be considered an error.

The **Reservation Key** list contains the 8-byte reservation keys for all Initiators that have registered through all ports with the Target.

### 19.12.3 Parameter Data for Read Reservations

Table 166: PERSISTENT RESERVE IN, parameter data for Read Reservations

Byte	Bit							
	7	6	5	4	3	2	1	0
0-3	(MSB) Generation (LSB)							
4-7	(MSB) Additional length (n-7) (LSB)							
8-n	(MSB) Reservation descriptors (LSB)							

The **Generation** field shall be as defined for the Persistent Reserve In Read Keys parameter data. The Additional Length field contains a count of the number of bytes to follow in the Reservation Descriptor(s).

If the **Allocation length** specified by the PERSISTENT RESERVE IN command is not sufficient to contain the entire parameter list, then only the bytes from 0 to the maximum allowed allocation length shall be sent to the Initiator. The remaining bytes shall be truncated, although the Additional Length field shall still contain the actual number of bytes of the Reservation Descriptor(s) and shall not be affected by the truncation. This shall not be considered an error.

The format of the **Reservation Descriptors** is defined in the Persistent Reserve In Reservation Descriptor table. There shall be a Reservation Descriptor for the persistent reservation, if any, present in the Target having a persistent reservation.

Table 167: PERSISTENT RESERVE IN, Read Reservation Descriptor

Byte	Bit							
	7	6	5	4	3	2	1	0
0-7	(MSB) Reservation key (LSB)							
8-11	(MSB) Scope-specific address (LSB)							
12	Reserved							
13	Scope=0				Type			
14-15	(MSB) Extent Length=0 (LSB)							

The **Scope** of each persistent reservation created by a PERSISTENT RESERVE OUT command will be returned. See the PERSISTENT RESERVE OUT command section for details.

## 19.13 PERSISTENT RESERVE OUT (5F)

Table 168: PERSISTENT RESERVE OUT (5F)

Byte	Bit							
	7	6	5	4	3	2	1	0
0	Command Code = 5Fh							
1	Reserved = 0			Service Action				
2	Scope=0				Type			
3-6	Reserved = 0							
7-8	Parameter List Length = 18h							
11	VU = 0		Reserved = 0				FLAG	LINK

The PERSISTENT RESERVE OUT command is used to request service actions that reserve the drive for the exclusive or shared use of the initiator. The command uses other service actions to manage and remove such reservations. This command is used in conjunction with the PERSISTENT RESERVE IN command, and should not be used with the RESERVE and RELEASE commands.

Note: If a PERSISTENT RESERVE OUT command is received when a RESERVE is active for the drive, the command will be rejected with **Reservation Conflict** status.

**Parameter List Length** must be 18h. If not, Check Condition status will be returned, with sense key of Illegal Request and additional sense code of Parameter List Length Error.

### 19.13.1 Service Action

The following service action codes are supported.

**Table 169: PERSISTENT RESERVE OUT, Service Action Code**

<b>Code</b>	<b>Name</b>	<b>Description</b>
<b>00h</b>	<b>Register</b>	Register a reservation key
<b>01h</b>	<b>Reserve</b>	Create a persistent reservation using a reservation key
<b>02h</b>	<b>Release</b>	Release a persistent reservation
<b>03h</b>	<b>Clear</b>	Clear all reservation keys and all persistent reservations
<b>04h</b>	<b>Preempt</b>	Preempt persistent reservations from another Initiator
<b>05h</b>	<b>Preempt and Abort</b>	Preempt persistent reservations from another Initiator and clear the task set for the preempted Initiator
<b>06h</b>	<b>Register and Ignore existing key</b>	Register a reservation key
<b>07h-1Fh</b>	<b>Reserved</b>	Reserved

## 19.13.2 Type

The **Type** field specifies the characteristics of the persistent reservation being established for all customer data sectors. The table below describes the supported types and how read and write commands are handled for each reservation type.

**Table 170: PERSISTENT RESERVE OUT, Type Code**

Code	Name	Description
0h	Reserved	Reserved
1h	Write Exclusive	Reads Shared: Any initiator may execute commands that transfer from the media. Writes Exclusive: Only the initiator with the reservation may execute commands that transfer data to the media; Reservation Conflict status will be returned to other initiators.
2h	Reserved	Reserved
3h	Exclusive Access	Reads Exclusive: Only the initiator with the reservation may execute commands that transfer data from the media; Reservation Conflict status will be returned to other initiators. Writes Exclusive: Only the initiator with the reservation may execute commands that transfer data to the media; Reservation Conflict status will be returned to other initiators.
4h	Reserved	Reserved
5h	Write Exclusive Registrants Only	Reads Shared: Any initiator may execute commands that transfer from media. Writes Exclusive: Only registered initiators may execute commands that transfer data to the media; Reservation Conflict status will be returned to other initiators.
6h	Exclusive Access Registrants Only	Reads Exclusive: Only registered initiators may execute commands that transfer data from the media; Reservation Conflict status will be returned to other initiators. Writes Exclusive: Only registered initiators may execute commands that transfer data to the media; Reservation Conflict status will be returned to other initiators.
7h-Fh	Reserved	Reserved

### 19.13.3 Parameter list

The **Parameter List** required to perform the PERSISTENT RESERVE OUT command is defined in the table below. All fields must be sent on all PERSISTENT RESERVE OUT commands, even if the field is not required for the specified service action.

**Table 171: Parameter List**

Byte	Bit							
	7	6	5	4	3	2	1	0
0-7	(MSB) <b>Reservation Key</b> (LSB)							
8-15	(MSB) <b>Service Action Reservation Key</b> (LSB)							
16-19	(MSB) <b>Scope-Specific Address</b> (LSB)							
20	<b>Reserved = 0</b>							<b>APTPL</b>
21-23	<b>Reserved = 0</b>							

**Reservation Key** contains an 8-byte value provided by the initiator, and identifies the initiator that issued the PERSISTENT RESERVE OUT command. The Reservation Key must match the registered reservation key for the initiator for all service actions except REGISTER and REGISTER AND IGNORE EXISTING KEY.

**Service Action Reservation Key** contents vary based on the service action. For REGISTER and REGISTER AND IGNORE EXISTING KEY, the Service Action Reservation Key must contain the new reservation key to be registered. For PREEMPT and PREEMPT AND ABORT, the field contains the reservation key of the persistent reservation that is being preempted. This field is ignored for all other service actions.

**Scope-Specific Address** is ignored.

**APTPL (Activate Persist Through Power Loss)** bit is valid only for REGISTER and REGISTER AND IGNORE EXISTING KEY, and is ignored for all other service actions. If the last valid APTPL bit value received is zero, power loss will cause all persistent reservations to be released, and all reservation keys to be removed. If the last valid APTPL bit value received is one, any persistent reservation and all reservation keys for all initiators will be retained across power cycles.

## 19.13.4 Summary

Table 172: PERSISTENT RESERVE OUT, Service Action, Parameters

Service Action	Parameters						Generation counter
	Scope Type	Rsv Key	SvcAct RsvKey	S-spec addr	Extent length	APTPL	
(0) Register	ignore	verify	save	ignore	ignore	apply	+ 1
(1) Reserve	apply	verify	ignore	ignore	ignore	ignore	---
(2) Release	apply	verify	ignore	ignore	ignore	ignore	---
(5) Preempt and Abort	apply	verify	save	ignore	ignore	ignore	+ 1

### 19.13.4.1 Scope, Type

The Scope and the Type are applied in the process for the Reserve, Release, and Preempted and Clear service action but they are ignored in the process for the Register service action because they are not used.

### 19.13.4.2 Reservation Key

The Reservation Key is verified in each service action process. If the Initiator that registered a key is different from the Initiator requesting PERSISTENT RESERVE OUT command, the drive returns a **Reservation Conflict** status.

### 19.13.4.3 Service Action Reservation Key

On Register service action, the drive saves the key specified in the Service Action Reservation Key field as a key of Initiator requesting PERSISTENT RESERVE OUT command.

On Preempt and Clear service action, the reservation that has a key specified in the Service Action Reservation Key field is preempted.

On other service actions, this field is ignored.

### 19.13.4.4 Scope-specified address

Parameter in the Scope-specified address field is ignored by the drive.

### 19.13.4.5 Extent length

Parameter in the Extent length field is ignored by the drive.

### 19.13.4.6 APTPL

The APTPL (Active Persist Through Power Loss) is valid only for the Register service action. The drive ignores the APTPL in other service actions.

The following table shows the relationship between the last valid APTPL value and information held by the drive.

**Table 173: APTPL and information held by a drive**

Information held by the drive	The last valid APTPL value	
	0	1
Registration	all keys are set to 0	retained
Persistent Reservation	all are removed	retained
Generation counter	set to 0	set to 0

### 19.13.4.7 Generation counter

The drive increments the Generation counter when Register service action or Preempt and Clear service action complete successfully.

## 19.14 PRE-FETCH (34)

Table 174: PRE-FETCH (34)

Byte	Bit							
	7	6	5	4	3	2	1	0
0	Command Code = 34h							
1	Reserved = 0			Reserved = 0			Immed = 0	Obsolete
2-5	(MSB) Logical Block Address (LSB)							
6	Reserved = 0							
7-8	(MSB) Transfer Length (LSB)							
9	VU = 0		Reserved = 0			FLAG	LINK	

The PRE-FETCH command requests the drive to transfer data to the cache. No data is transferred to the Initiator.

- **Transfer length** field specifies the number of contiguous blocks of data that are to be transferred into the cache. A transfer length of zero indicates that blocks are to be transferred into the cache until the segment is filled or until the last block on the media.
- **Immed** (Immediate) must be zero. An immediate bit of zero indicates that the status shall not be returned until the operation has completed.

If the Immed bit is set to one, the drive returns a **Check Condition** status. The sense key shall be set to *Illegal Request* and the additional sense code shall be set to *Invalid Field in CDB*.

## 19.15 READ (6) - (08)

Table 175: READ (6) - (08)

Byte	Bit							
	7	6	5	4	3	2	1	0
0	Command Code = 08h							
1	Reserved = 0			(MSB) LBA				
2-3	Logical Block Address							(LSB)
4	Transfer Length							
5	VU = 0		Reserved = 0				FLAG	LINK

The READ command requests the drive to transfer from the medium to the initiator the specified number of blocks (Transfer Length) starting at the specified Logical Block Address (LBA).

- **Logical block address** field specifies the logical unit at which the READ operation shall begin.
- **Transfer length** field specifies the number of blocks to be transferred. A value of zero implies 256 blocks are to be transferred.

**Note:** Error recovery procedure (ERP) handles errors. The error recovery parameters specified by the MODE SELECT command control ERPs. If the drive is formatted with protection information, no protection information will be transmitted or checked.

## 19.16 READ (10) - (28)

Table 176: READ (10) - (28)

Byte	Bit							
	7	6	5	4	3	2	1	0
0	Command Code = 28h							
1	RDPROTECT		DPO	FUA	Rsvd=0	FUA_NV	Obsolete	
2-5	(MSB) Logical Block Address							(LSB)
6	Reserved = 0							
7-8	(MSB) Transfer Length							(LSB)
9	VU = 0	Reserved = 0				FLAG	LINK	

The READ (10) command requests the drive to transfer data to the Initiator. The larger LBA and Transfer Length fields permit greater quantities of data to be requested per command than with the READ command and are required to access the full LBA range of the larger capacity drives.

- **FUA\_NV** (Force Unit Access Non-Volatile Cache) may be set to 0 or 1, but is ignored since NV\_SUP=0 in Inquiry Page 86h.
- **Transfer length** The number of contiguous blocks to be transferred. If the transfer length is zero, the seek occurs, but no data is transferred. This condition is not considered an error. If read ahead is enabled, a read ahead is started after the seek completes.
- **DPO** (Disable Page Out) bit of one indicates that the data accessed by this command is to be assigned the lowest priority for being written into or retained by the cache. A DPO bit of one overrides any retention priority specified in the Mode Select Page 8 Caching Parameters. A DPO bit of zero indicates the priority is determined by the retention priority. The Initiator should set the DPO bit when the blocks read by this command are not likely to be read again in the near future.
- **FUA** (Force Unit Access) bit of one indicates that the data is read from the media and not from the cache. A FUA bit of zero allows the data to be read from either the media or the cache.
- **RDPROTECT** defines the manner in which protection information read from disk shall be checked during processing of the command. Protection information is stored on disk, and may be transmitted to the drive's internal data buffer and to the initiator with the user data. If the drive is not formatted with protection information, RDPROTECT must be set to 000b, else **Check Condition** status will be returned with sense key of Illegal Request and additional sense code of Invalid Field in CDB.
- RDPROTECT=000b

Protection information is not transmitted to the initiator and is not checked.

RDPROTECT=001b

- Protection information is transmitted to the initiator with the user data
- Logical Block Guard is checked
- Logical Block Application Tag is checked (applies to READ(32) command only)
- Logical Block Reference Tag is checked

#### RDPROTECT=010b

- Protection information is transmitted to the initiator with the user data
- Logical Block Guard is not checked
- Logical Block Application Tag is checked (applies to READ(32) command only)
- Logical Block Reference Tag is checked

#### RDPROTECT=011b

- Protection information is transmitted to the initiator with the user data
- Logical Block Guard is not checked
- Logical Block Application Tag is not checked
- Logical Block Reference Tag is not checked

#### RDPROTECT=100b

- Protection information is transmitted to the initiator with the user data
- Logical Block Guard is checked
- Logical Block Application Tag is not checked
- Logical Block Reference Tag is not checked

#### RDPROTECT=101b, 110b, 111b

These values are reserved. **Check Condition** status will be returned with sense key of Illegal Request and additional sense code of Invalid Field in CDB.

If a check of the protection information fails, **Check Condition** status will be returned with sense key of Aborted Command and additional sense code indicating which protection field check failed.

Refer to the ANSI T10 standards for additional details of protection information.

If the transfer length is zero, no data is transferred. The CDB is validated and protocol checked and, if no problems are found, **Good** status is returned immediately. This condition is not considered an error.

## 19.17 READ (12) - (A8)

Table 177: Read (12) - (A8)

Byte	Bit							
	7	6	5	4	3	2	1	0
0	Command Code = A8h							
1	RDPROTECT			DPO	FUA	Rsvd = 0	FUA_N V	Rsvd = 0
2 - 5	(MSB) Logical Block Address (LSB)							
6 - 9	(MSB) Transfer Length (LSB)							
10	Reserved = 0							
11	VU = 0		Reserved = 0				FLAG	LINK

The READ(12) command causes the drive to transfer data to the initiator. See the READ(10) description for the definitions of the fields in this command.

## 19.18 READ (16) - (88)

Table 178: READ (16) - (88)

Byte	Bit							
	7	6	5	4	3	2	1	0
0	Command Code = 88h							
1	RDPROTECT			DPO	FUA	Rsvd=0	FUA_NV	Rsvd=0
2 - 5	(MSB) Logical Block Address (LSB)							
6 - 9	(MSB) Transfer Length (LSB)							
10	Reserved = 0							
11	VU = 0		Reserved = 0				FLAG	LINK

The READ(16) command causes the drive to transfer data to the initiator. See the READ(10) description for the definitions of the fields in this command.

## 19.19 READ (32) - (7F/09)

Table 179: Read (32) - (7F/09)

Byte	Bit							
	7	6	5	4	3	2	1	0
0	Command Code = 7Fh							
1	VU = 0		Reserved = 0				FLAG	LINK
2-5	Reserved = 0							
6	Reserved = 0			Group Number = 0				
7	Additional CDB Length = 18h							
8 - 9	Service Action = 0009h							
10	RDPROTECT			DPO	FUA	Rsvd=0	FUA_NV	Rsvd=0
11	Reserved = 0							
12 -19	(MSB) Logical Block Address (LSB)							
20 - 23	(MSB) Expected Initial Logical Block Reference Tag (LSB)							
24 - 25	(MSB) Logical Block Application Tag (LSB)							
26-27	(MSB) Logical Block Application Tag Mask (LSB)							
28 - 31	(MSB) Transfer Length (LSB)							

The READ command requests that the drive transfer data from disk to the initiator. Each logical block transferred includes user data and may include protection information, based on the RDPROTECT field and the drive format.

If the RTO\_EN bit is set to zero in the READ CAPACITY (16) parameter data, **Check Condition** status will be returned with sense key of Illegal Request and additional sense code of Invalid Command Operation Code. If RTO\_EN is one, this command will be processed normally.

See READ (10) - (28) for descriptions of the RDPROTECT, DPO, FUA, Logical Block Address, and Transfer Length fields.

When checking of the Logical Block Reference Tag field is enabled, the Expected Initial Logical Block Reference Tag field contains the value of the Logical Block Reference Tag field expected in the protection information of the first logical block accessed by the command, instead of a value based on the LBA.

If the ATO bit is set to one in Mode Page 0A and checking of the Logical Block Application Tag field is enabled, the Logical Block Application Tag Mask field contains a value that is a bit mask for enabling the checking of the Logical Block Application Tag field in the protection information for each logical block accessed by the command. A Logical Block Application Tag Mask bit set to one enables the checking of the corresponding bit of the Expected Logical Block Application Tag field with the corresponding bit of the Logical Block Application Tag field in the protection information.

If the ATO bit is set to one in Mode Page 0A and the checking of the Logical Block Application Tag field is disabled, or if the ATO bit is set to zero, the Logical Block Application Tag Mask field and the Expected Logical Block Application Tag field are ignored.

## 19.20 READ BUFFER (3C)

Table 180: READ BUFFER (3C)

Byte	Bit							
	7	6	5	4	3	2	1	0
0	Command Code = 3Ch							
1	Reserved = 0			Mode				
2	Buffer ID = 0							
3-5	(MSB) Buffer Offset							(LSB)
6-8	(MSB) Allocation Length							(LSB)
9	VU = 0		Reserved = 0			FLAG	LINK	

The READ BUFFER command is used in conjunction with the WRITE BUFFER command as a diagnostic function for testing the memory of the drive and the SCSI bus integrity. This command does not alter the medium.

The function of this command and the meaning of fields within the command descriptor block depend on the contents of the mode field.

MODE	Description
00000	Read Combined Header and Data
00010	Read Data
00011	Descriptor
01010	Read Data from Echo Buffer
01011	Echo Buffer Descriptor
11010	Enable Expander Communications Protocol and Echo Buffer
All others	Not supported

### 19.20.1 Combined Header And Data (Mode 00000b)

In this mode a 4-byte header followed by data bytes is returned to the Initiator during the DATA IN phase. The Buffer ID and the buffer offset field are reserved.

The drive terminates the DATA IN phase when allocation length bytes of header plus data have been transferred or when the header and all available data have been transferred to the Initiator, whichever is less.

The 4-byte READ BUFFER header (see figure below) is followed by data bytes from the data buffer of the drive.

**Table 181: Read Buffer Header**

Byte	Bit						
	7	6	5	4	3	2	1
0	RSVD = 0						
1-3	(MSB)	Buffer Capacity					(LSB)

The buffer capacity specifies the total number of data bytes that are available in the data buffer of the drive. This number is not reduced to reflect the allocation length nor is it reduced to reflect the actual number of bytes written using the WRITE BUFFER command.

Following the READ BUFFER header the drive will transfer data from its data buffer.

## 19.20.2 Read Data (Mode 00010b)

In this mode, the DATA IN phase contains buffer data.

- **Buffer ID** field must be set to zero, indicating the data transfer buffer. If another value is specified, the command is terminated with **Check Condition** status. The drive shall set sense key to *Illegal Request* and additional sense code to *Illegal Field in CDB*.
- **Buffer Offset** specifies the offset of the memory space specified by the Buffer ID. The Initiator should conform to the offset boundary requirements returned in the READ BUFFER descriptor. If the value exceeds the buffer specified, the command is terminated with **Check Condition** status. The drive shall set sense key to *Illegal Request* and additional sense code to *Illegal Field in CDB*.
- **Allocation Length** The drive terminates the DATA IN phase when allocation length bytes of data have been transferred or when the header and all available data have been transferred to the Initiator, whichever is less.

### 19.20.3 Descriptor (Mode 00011b)

In this mode, a maximum of four bytes of READ BUFFER descriptor information are returned. The drive returns the descriptor information for the buffer specified by the Buffer ID.

- **Buffer ID** field should normally be set to zero, indicating the drive data transfer buffer. If any other value is specified, the drive returns all zeros in the READ BUFFER descriptor.
- **Buffer Offset** field is reserved.
- **Allocation Length** should be set to four or greater. The drive transfers the allocation length or four bytes of READ BUFFER descriptor, whichever is less. The allocation length of zero indicates no data is transferred. The allocation length of greater than zero and less than four (size of the Descriptor) is an invalid request and will cause the command to be terminated with **Check Condition** status. The drive shall set sense key to *Illegal Request* and additional sense code to *Illegal Field in CDB*.

The READ BUFFER descriptor is defined in the figure below.

**Table 182: Read Buffer Description**

Byte	Bit						
	7	6	5	4	3	2	1
0	Offset Boundary = 0x09						
1-3	(MSB) Buffer Capacity (LSB)						

The value contained in the Buffer Offset field of subsequent WRITE BUFFER and READ BUFFER commands should be a multiple of two to the power of the offset boundary. The offset boundary is always set to nine, which indicates Sector Boundaries.

## 19.20.4 Read Data from Echo Buffer (Mode 01010b)

In this mode the drive transfers data from the echo buffer. The echo buffer will transfer the same data as when the WRITE BUFFER command was issued with the mode field set to echo buffer.

WRITE BUFFER command with the mode field set to echo buffer should be sent prior to the READ BUFFER command; otherwise the READ BUFFER command will be terminated with **Check Condition** status and *Illegal Request*.

In this mode Read Buffer transfers the specified amount of data or the amount previously written with a Write Buffer using mode 1010b from the echo buffer, whichever is less.

Issuing a Read Buffer mode 1010b before a Write Buffer mode 1010b will cause indeterminate data to be returned.

The most significant two bytes of the Allocation Length are ignored. The specified amount of data transferred should not be larger than the echo buffer capacity. The echo buffer capacity may be determined by using Read Buffer mode 1011b. Any additional data transferred over and above the echo buffer capacity is regarded as indeterminate.

The Buffer ID and Buffer Offset fields are ignored in this mode.

**Note:** The echo buffer is a separate buffer from the data buffer used with other read buffer modes. It is intended to be used for domain validation purposes.

### 19.20.5 Echo Buffer Descriptor (Mode 01011b)

In this mode, a maximum of four bytes of Read Buffer Descriptor information is returned. The drive returns the descriptor information for the echo buffer. The Buffer Offset field is reserved in this mode and must be zero. The drive transfers the lesser of the allocation length or four bytes of following Echo Buffer Descriptor.

**Table 183: Echo Buffer Descriptor**

Byte	Bit							
	7	6	5	4	3	2	1	0
0	Reserved = 0							EBOS=0
1	Reserved = 0							
2	Reserved = 0				(MSB) Buffer Capacity			
3	Buffer Capacity (LSB)							

- **EBOS** (Echo Buffer Overwritten Supported) bit of zero indicates that the echo buffer is shared by all Initiators.
- **Buffer Capacity** field returns the size of the echo buffer in byte aligned to a 4-byte boundary.

## **19.20.6 Enable Expander Communications Protocol and Echo Buffer (Mode11010b)**

Receipt of a READ BUFFER command with this mode (11010b) causes a communicative expander to enter the expanded communication protocol mode. SCSI target devices that receive a READ BUFFER command with this mode shall process it as if it were a READ BUFFER command with mode 01010b (Read Data from Echo Buffer (Mode 01010b)\*, page 219).

## 19.21 READ CAPACITY (10) - (25)

Table 184: READ CAPACITY (10) - (25)

Byte	Bit							
	7	6	5	4	3	2	1	0
0	Command Code = 25h							
1	Reserved = 0			Reserved = 0				Obso- lete
2-5	(MSB) Logical Block Address							(LSB)
6-7	Reserved = 0							
8	Reserved = 0							PMI
9	VU = 0	Reserved = 0				FLAG	LINK	

The READ CAPACITY command returns information regarding the capacity of the drive.

- **Logical Block Address** is used in conjunction with the PMI bit.
- **PMI** (Partial Medium Indicator) indicates:

**PMI Description**

- 0** The drive returns the last LBA of the drive.
- 1** The drive returns the last LBA and block length in bytes are that of the LBA after which a substantial delay in data transfer will be encountered. This returned LBA shall be greater than or equal to the LBA specified by the LBA fields in the CDB.

This option provides the information that the Initiator needs to determine the amount of space available on the same track that is accessible without a head switch or seek.

### 19.21.0.1 Returned Data Format

The data returned to the Initiator in response to the READ CAPACITY command is described here. The data is returned in the DATA IN phase.

**Table 185: Format of READ CAPACITY command reply**

Byte	Bit							
	6	7	5	4	3	2	1	0
0-3	(MSB) Maximum Logical Block Address (LSB)							
4-7	(MSB) Block Length (LSB)							

- **Block Length** specifies the length in bytes of each block of user data (not including protection information).

## 19.22 READ CAPACITY (16) (9E/10)

Table 186: Read Capacity (16) (9E/10)

Byte	Bit							
	6	7	5	4	3	2	1	0
0	Command Code = 9Eh							
1	Reserved = 0				Service Action = 10h			
2-9	(MSB) Logical Block Address (LSB)							
10-13	(MSB) Allocation Length (LSB)							
14	Reserved = 0							PMI
15	VU = 0		Reserved = 0				FLAG	Link

The READ CAPACITY (16) (9E/10) command returns information regarding the capacity of the drive. This command is processed like the standard READ CAPACITY (25) command.

## 19.22.1 Returned Data Format

The following data is returned to the initiator in the DATA OUT phase.

**Table 187: Returned Data Format**

Byte	Bit							
	6	7	5	4	3	2	1	0
0 - 7	(MSB) Maximum Logical Address (LSB)							
8 - 11	(MSB) Block Length (LSB)							
12	Reserved = 0						RTO_E N	PROT_ EN
13 - 31	Reserved = 0							

- **RTO\_EN (Reference Tag Own Enable)** bit set to one indicates that application client ownership of the Logical Block Reference Tag field in protection information is enabled (i.e. the drive was formatted with protection information enabled and the RTO\_REQ bit was set to one). An RTO\_EN bit set to zero indicates that application client ownership of the Logical Block Reference Tag field in protection information is disabled.

**PROT\_EN (Protection Enable)** bit set to one indicates that the drive was formatted with protection information enabled. A PROT\_EN bit set to zero indicates that the drive was not formatted with protection information enabled.

## 19.23 READ DEFECT DATA (37)

Table 188: READ DEFECT DATA (37)

Byte	Bit							
	7	6	5	4	3	2	1	0
0	Command Code = 37h							
1	Reserved = 0			Reserved = 0				0
2	Reserved = 0			Plist	Glist	Defect List Format		
3-6	Reserved = 0							
7-8	(MSB) Allocation Length							(LSB)
9	VU = 0		Reserved = 0			FLAG	LINK	

The READ DEFECT DATA command requests that the Target transfer the medium defect data to the Initiator.

If the Target is unable to access any medium defect data it will return a **Check Condition** status with the appropriate sense key. The sense key will be set to either *Medium Error* (03h) if a medium error occurred or *No Sense* (00h) if the list does not exist and the additional sense code will be set to *Defect List Error* (19h).

- **Plist** bit set to one indicates that the Target returns the Plist. A Plist bit of zero indicates that the Target shall not return the Plist of defects.
- **Glist** bit set to one indicates that the Target returns the Glist. A Glist bit of zero indicates that the Target shall not return the Glist.

**Note:** With both bits set to one Plist and Glist the Target will return both the primary and grown defect lists. With both bits set to zero, the Target will return only a 4-byte Defect List Header.

- **Defect List format** field is used by the Initiator to indicate the preferred format for the defect list.

The Defect List Format of '100 (Bytes from Index Format)' and '101 (Physical Sector Format)' are supported. If the requested format is not supported by the drive, it will return the defect list in its default format '101' and then terminate the command with **Check Condition** status. The sense key will be set to *Recovered Error* (01h) and the additional sense code will be set to *Defect List Not Found* (1Ch).

The drive sends defect list (Defect Descriptors) in a 8-byte Absolute Block Address (ABA) format that follows a four byte Defect List Header.

The Target will transfer all of the Read Defect Data up to the number of bytes allocated by the Initiator.

**Table 189: Defect List Format**

<b>Preferred Defect List Format</b>	<b>Returned Defect List Format</b>
Block (000b)	Physical Sector
Bytes from Index (100b)	Bytes from Index
Physical Sector (101b)	Physical Sector
Vendor Unique (110b)	Physical Sector
Reserved (001b)	
Reserved (010b)	
Reserved (011b)	
Reserved (111b)	

**Note:** The drive will terminate the Data In phase when the Allocation Length has been transferred or when all available Defect Data has been transferred to the Initiator, whichever is less.

The Read Defect Data contains a 4-byte header followed by zero or more defect descriptors.

## 19.23.1 Defect List Header

Table 190: Defect List Header

Byte	Bit							
	7	6	5	4	3	2	1	0
	Defect List Header							
0	Reserved = 0							
1	Reserved = 0			Plist	Glist	Defect List Format		
2-3	Defect List length							
	(MSB)							(LSB)

## 19.23.2 Defect List Descriptor

Table 191: Defect List Descriptor

Byte	Bit							
	7	6	5	4	3	2	1	0
	Defect List Descriptor							
0-7	Defect Descriptor 0							
.								
8n - (8n+7)	Defect Descriptor n							

### 19.23.3 Bytes from Index Format (100b)

Table 192: Defect Descriptors of Bytes from Index Format

Byte	Defect Descriptors
0-2	(MSB) Cylinder Number of Defect (LSB)
3	Head Number of Defect
4-7	(MSB) Defect Bytes from Index (LSB)

Defect Bytes from Index is gotten using the following equation:

$$\text{Bytes from Index} = (\text{Physical Sector Number}) * N$$

Where: N = Bytes per sector

## 19.23.4 Physical Sector Format (101b)

Table 193: Defect Descriptors of Physical Sector Format

Byte	Defect Descriptors
0-2	(MSB) Cylinder Number of Defect (LSB)
3	Head Number of Defect
4-7	(MSB) Defective Sector Number (LSB)

The Defect List Format field specifies the format of the defect list data returned by the Target.

The Defect List Length field specifies the length in bytes of the defect descriptors that follow. The Defect List Length is equal to eight times the number of defect descriptors.

Normally the Target will set the Defect List Length field to the amount of space needed to contain the entire defect list. However, the Target is capable of building a defect list with a length such that the entire list cannot be transferred using the maximum allocation length. If the defect list grows beyond 8191 entries, the defect data cannot be transferred with an allocation length of 0FFFFh. The Target will transfer a partial defect list and return **Check Condition** status with the sense key set to *Recovered Error* and the additional sense code set to *Partial Defect List Transferred*. The defect list length will be set to 0FFF8h, indicating the maximum number of defect descriptors that can be transferred. Defects beyond this number cannot be read by the Initiator.

## 19.24 READ DEFECT DATA (B7)

Table 194: READ DEFECT DATA (B7)

Byte	Bit							
	7	6	5	4	3	2	1	0
0	Command Code = B7h							
1	Reserved = 0			Plist	Glist	Defect List Format		
2-5	Reserved = 0							
6-9	(MSB) Allocation Length (LSB)							
10	Reserved = 0							
11	VU = 0		Reserved = 0			FLAG	LINK	

(See Section 19.23 “READ DEFECT DATA (37)” on page 226.)

## 19.24.1 Defect List Header

Table 195: Defect List Header

Byte	Bit							
	7	6	5	4	3	2	1	0
	<b>Defect List Header</b>							
<b>0</b>	<b>Reserved = 0</b>							
<b>1</b>	<b>Reserved = 0</b>			<b>Plist</b>	<b>Glist</b>	<b>Defect List Format</b>		
<b>2-3</b>	<b>Reserved = 0</b>							
<b>4-7</b>	<b>Defect List length</b>							<b>(LSB)</b>

(See Defect List Header for Read Defect Data (37) in Section Table 19.23.1, “Defect List Header,” on page 228.)

## 19.24.2 Defect List Descriptor

Table 196: Defect List Descriptor

Byte	Bit							
	7	6	5	4	3	2	1	0
	Defect List Descriptor							
0-7	Defect Descriptor 0							
.								
8n - (8n+7)	Defect Descriptor n							

(See Defect List Descriptor for Read Defect Data (37) in Section 19.23.2 “Defect List Descriptor” on page 229.)

### 19.24.3 Bytes from Index Format (100b)

Table 197: Defect Descriptors of Bytes from Index Format

Byte	Defect Descriptors
0-2	(MSB) Cylinder Number of Defect (LSB)
3	Head Number of Defect
4-7	(MSB) Defect Bytes from Index (LSB)

Defect Bytes from Index is derived using the following equation:

$$\text{Bytes from Index} = (\text{Physical Sector Number}) + N$$

where N = Bytes per sector.

## 19.24.4 Physical Sector Format (101b)

Table 198: Defect Descriptors of Physical Sector Format

Byte	Defect Descriptors
0-2	(MSB) Cylinder Number of Defect (LSB)
3	Head Number of Defect
4-7	(MSB) Defective Sector Number (LSB)

## 19.25 READ LONG (3E)

Table 199: READ LONG (3E)

Byte	Bit							
	7	6	5	4	3	2	1	0
0	Command Code = 3Eh							
1	Reserved = 0			Reserved = 0			Correct = 0	Obsolete
2-5	(MSB) Logical Block Address (LSB)							
6	Reserved = 0							
7-8	(MSB) Byte Transfer Length (LSB)							
9	VU = 0	Reserved = 0				FLAG	LINK	

The READ LONG command requests the drive to transfer one block of data to the Initiator. The transfer data includes data and ECC field data.

- **Correct** bit of zero causes the logical block to be read without any correction attempts. When the bit is one, data will be corrected with offline ECC correction before being transferred.
- **Logical Block Address** field specifies the logical block at which the read operation shall occur.
- **Byte Transfer Length** field must specify exactly the number of bytes of data that are available for transfer. If a non-zero byte transfer length does not match the available data length, the Target terminates the command with **Check Condition** status, the sense key is set to *Illegal Request*, and an additional sense code set to *Invalid Field in CDB*. The valid and ILI bits are set to one and the information field is set to the difference of the requested length minus the actual length in bytes. Negative values are indicated by two's complement notation.

The transfer length is calculated as follows:

$$\text{transfer length} = \text{logical block size} + 56$$

The data read by this command is neither read from nor retained in the cache.

## 19.26 REASSIGN BLOCKS (07)

Table 200: REASSIGN BLOCKS (07)

Byte	Bit							
	7	6	5	4	3	2	1	0
0	Command Code = 07h							
1	Reserved = 0				Reserved = 0			
2	Reserved = 0							
3								
4								
5	VU = 0	Reserved = 0				FLAG	LINK	

The REASSIGN BLOCKS command requests the drive to reassign a logical block to an available spare. The REASSIGN BLOCKS command attempts to allocate spare blocks on a spare track. The LBA is transferred to the drive during the DATA OUT phase. One to four blocks may be specified for relocation per REASSIGN BLOCKS command.

Reassignment is complete upon the completion of the REASSIGN BLOCKS command. At this time, the defective logical block address has been added to the Glist.

All data is preserved during a reassign command except for the target LBA data. The Mode Page 0h DRRT (Disable Restore Reassign Target) bit determines if the reassign blocks command will attempt to recover the Target LBA data. If the Target cannot recover the data at the Target LBA then the Initiator will have to restore the data after the REASSIGN BLOCKS command completes successfully.

If the reassignment begins to move data and is interrupted or fails to complete successfully, the Target enters a degraded mode of operation. In this mode data can be read but writing to the drive is prohibited.

Upon successful completion of this command, the location of the physical sectors reassigned during the command are added to the Glist. The reassigned sectors are marked defective and cannot be accessed again until after a format operation discards the Glist.

Following is the format of the data sent by the Initiator during the DATA OUT phase.

**Table 201: Format of Reassign Blocks data**

Byte	Bit						
	7	6	5	4	3	2	1
0	Reserved = 0						
1	Reserved = 0						
2-3	(MSB) Defect List Length = 4/8/12/16 (LSB)						
4-7	(MSB) Defect Logical Block Address 1 (LSB)						
8-11	(MSB) Defect Logical Block Address 2 (LSB)						
12-15	(MSB) Defect Logical Block Address 3 (LSB)						
16-19	(MSB) Defect Logical Block Address 4 (LSB)						

- **Defect List Length** must be 4, 8, 12, or 16. Otherwise, the drive returns *Check Condition* with a sense key of *Illegal Request*.
- **Defective Logical Block Address** is four bytes in length. The Initiator can specify from 1 to 4 Defective Logical Block Addresses according to the Defect List Length from 4 to 16, respectively. LBAs are not required to be in ascending order.

## 19.27 RECEIVE DIAGNOSTICS RESULTS (1C)

Table 202: RECEIVE DIAGNOSTIC RESULTS (1C)

Byte	Bit							
	7	6	5	4	3	2	1	0
0	Command Code = 1Ch							
1	Reserved = 0			Reserved = 0				PCV
2	Page Code							
3	(MSB) Allocation Length							
4					(LSB)			
5	VU = 0		Reserved = 0			FLAG	LINK	

The RECEIVE DIAGNOSTIC RESULTS command requests that analysis data requested by a SEND DIAGNOSTIC command be sent to the Initiator.

- **PCV** (Page Code Valid) bit of zero indicates that the most recent SEND DIAGNOSTIC command shall define the data returned by this command. PCV bit of one indicates that the contents of the Page Code field shall define the data returned by this command.
- **Allocation Length** specifies the amount of data to be returned to the Initiator. This value may be zero and this is not considered an error. The Target terminates the Data In phase when all available data has been transferred or when the number of bytes transferred equals the Parameter List Length.

This command may also be used to retrieve a Diagnostic Page from an enclosure.

When requested to communicate with the enclosure via the Send and RECEIVE DIAGNOSTIC commands, the Target goes through a 'discovery phase' with the enclosure as defined in the SFF-8067 standard. The results of this 'discovery phase', determine whether the enclosure: 1) does not support Enclosure Services, 2) supports only the 'short' Enclosure Service mode as defined by SFF-8045, or 3) supports the 'long' Enclosure Service mode as defined by SFF-8067. After the 'discovery phase' the drive behaves in accordance with the Enclosure Service mode capabilities of the enclosure. The drive does not attempt to remember the Enclosure Service capabilities of the enclosure, but rather, in accordance with the SFF-8067 standard, re-performs the 'discovery phase' for each Send and RECEIVE DIAGNOSTIC command received.

If the Target determines that the enclosure does not support Enclosure Services, any attempts to access the Diagnostic Pages in the enclosure will result in CHECK CONDITION status and sense data is built with the Sense Key and Additional Sense Code indicating ENCLOSURE SERVICES UNAVAILABLE. In this case, only the Diagnostic Pages supported by the Target may be requested.

If the Target determines that the enclosure supports the 'short' form of Enclosure Services, Diagnostic Page 08h is returned in response to a request for any valid Diagnostic Page (i.e. 01h-0Fh).

If the Target determines that the enclosure supports the 'long' form of Enclosure Services, a request for the page is passed on to the enclosure. Any diagnostic information returned to the Target is transferred to the Initiator. If the request for enclosure transfer fails, the command is terminated with CHECK CONDITION status and sense data is built with the Sense Key and Additional Sense Code indicating ENCLOSURE SERVICES UNAVAILABLE.

## 19.27.1 Receive Diagnostic Results Page 0

This page contains a list of supported pages.

**Table 203: Receive Diagnostic Results page 0**

Byte	Bit							
	7	6	5	4	3	2	1	0
0	Page Code = 0							
1	Reserved = 0							
2-3	Page Length = 12h							
5-19	ESI Pages = 01h - 0Fh							
20	Translate address page = 40h							
21	Device LED Control Page = A0h							

The supported diagnostic page returns a list of supported pages in ascending order.

## 19.27.2 Enclosure Service Information (ESI) Page Format

The drive supports the following enclosure pages as specified by the “SCSI-3 Enclosure Service (SES) Rev 8a” standard. Please refer to that standard for more definition on these pages. Note that the drive does not attempt to process the information in these pages, but only acts as a pass through node, to allow the initiator to communicate with the enclosure.

**Table 204: Enclosure Page Support for Send and Receive Diagnostic Commands**

Page Code	Send Diagnostic Command	Receive Diagnostic Command
01h	Reserved	Configuration
02h	Enclosure Control	Enclosure Status
03h	Reserved	Help Text
04h	String Out	String In
05h	Threshold Out	Threshold In
06h	Array Control	Array Status
07h	Reserved	Element Descriptor
08h	Reserved	Short Enclosure Status
09-0Fh	Reserved for SES	Reserved for SES

These pages are formatted as in the following table.

**Table 205: ESI Page Format**

Byte	Bit							
	7	6	5	4	3	2	1	0
0	Page Code = 1h-0Fh							
1	Page Specific							
2	(MSB) Page Length (LSB)							
3								
n	Page Specific							

If the enclosure supports 'short' mode, only page 08h is supported. If the enclosure supports 'long' mode, pages 01h-0Fh are supported.

### 19.27.3 Receive Diagnostic Results Page 40

Using the SEND DIAGNOSTIC command, an address in either physical or logical format is supplied to the drive. This page is then used to retrieve the address translated into the other format.

**Table 206: Receive Diagnostic Results Page 40**

Byte	Bit							
	7	6	5	4	3	2	1	0
0	Page Code = 40h							
1	Reserved = 0							
2-3	Page Length							
4	Reserved = 0					Supplied format		
5	RA	ALTS	ALTT	Reserved=0		Translate format		
6-n	Translated Address							

- **Page Length** is set to 02h if the address is in a Reserved Area (RA =1). Otherwise, Page Length is set to 06h if the Translate Format is Block format, or 0Ah if the Translate Format is Bytes From Index format or Physical Sector format.
- **Supplied Format** is the value supplied by the SEND DIAGNOSTIC command; it may be one of the three following values:
  - **000b** Block format
  - **100b** Bytes From Index format
  - **101b** Physical Sector format
- **Translate Format** is the value supplied by the SEND DIAGNOSTIC command and specifies the format in which the address has been translated into List. If the supplied format is the Block format, the Translate format must be either Bytes from Index or Physical Sector format. If the supplied format is the Bytes from Index or Physical Sector format, the Translate format must be Block format. Otherwise the Target will terminate the command with **Check Condition** status.
- **RA (Reserved Area)** is set to on if the translated block is an inaccessible sector, which could reflect a defect, an unused sector on a spare cylinder, or a sector beyond the Maximum Customer LBA.
- **ALTS (Alternate Sector)** is set to one if the translated block is a sector in a spare cylinder that points to a reassigned customer sector.
- **ALTT (Alternate Track)** is not used.
- **Translated Address** contains the address in the translate format. If it is an LBA, it is contained within the first four bytes of the field (bytes 6 to 9) of the page data. For a physical format it is as follows:

**Table 207: Translated address**

Byte	Bit							
	7	6	5	4	3	2	1	0

<b>6-8</b>	<b>Cylinder Number</b>
<b>9</b>	<b>Head Number</b>
<b>10-13</b>	<b>Sector Number or Bytes from Index</b>

## 19.27.4 Receive Diagnostic Page A0h

The Receive Diagnostic Device LED Control Page A0h is returned as a result of the Send Diagnostic Device LED Control Page A0h. For a description of the parameters in this page, see 19.34.3, "Send Diagnostic Page A0h" on page 231.

**Table 208: Device LED Control Page - Receive Diagnostic**

Byte	Bit							
	7	6	5	4	3	2	1	0
0	Page Code = A0h							
1	Reserved = 0							
2	Page Length = 0002h							
3	(MSB)							(LSB)
4	Reserved = 0							
5	Reserved = 0							SBDL

## 19.28 RELEASE (17)

Table 209: RELEASE (17)

Byte	Bit							
	7	6	5	4	3	2	1	0
0	Command Code = 17h							
1	Reserved = 0		3rdPty=0	3rd Party ID			Ext=0	
2	Reservation Identification							
3-4	Reserved = 0							
5	VU = 0		Reserved = 0			FLAG	LINK	

The RELEASE command is used to release a LUN previously reserved. It is not an error for an Initiator to release a LUN that is not currently active. The drive returns **Good** status without altering the reservation.

- **3rdPty** must be 0. Third Party reservations are not supported. If the 3rdPty bit is not zero, Check Condition status is returned with a sense key of Illegal Request and additional sense code of Invalid Field in CDB.
- **3rd Party ID** is ignored.
- **Extents** must be 0. Extension is not supported by the drive.
- **Reservation Identification** field is ignored.

## 19.29 RELEASE (57)

Table 210: RELEASE (57)

Byte	Bit							
	7	6	5	4	3	2	1	0
0	Command Code = 57h							
1	Reserved = 0		3rdPty=0	Reserved = 0			Ext = 0	
2	Reservation Identification							
3	3rd Party Device ID							
4-8	Reserved = 0							
9	VU = 0		Reserved = 0			FLAG	LINK	

The RELEASE command is used to release a LUN previously reserved. It is not an error for an Initiator to release a LUN that is not currently active. The drive returns **Good** status without altering the reservation.

- **3rdPty** must be 0. Third Party reservations are not supported. If the 3rdPty bit is not zero, Check Condition status is returned with a sense key of Illegal Request and additional sense code of Invalid Field in CDB.
- **3rd Party ID** is ignored.
- **Extents** must be 0. Extension is not supported by the drive.
- **Reservation Identification** field is ignored.

## 19.30 REPORT DEVICE IDENTIFIER (A3/05)

Table 211: REPORT DEVICE IDENTIFIER (A3/05)

Byte	Bit							
	7	6	5	4	3	2	1	0
0	Command Code = A3h							
1	Reserved = 0				Service Action = 05h			
2	Reserved = 0							
3	Reserved = 0							
4-5	(MSB) LUN=0 (LSB)							
6-9	(MSB) Allocation Length (LSB)							
10	Reserved = 0							
11	VU = 0		Reserved = 0				FLAG	LINK

The **REPORT DEVICE IDENTIFIER** command requests that the device server send device identification information to the application client.

The **LUN** contains the logical unit number parameter. This parameter is expected to be zero. Other value for this parameter will cause the command to terminate with a CHECK CONDITION status. The sense key is set to ILLEGAL REQUEST, and the additional sense code is set to INVALID FIELD IN CDB.

The **ALLOCATION LENGTH** field indicates how much space has been reserved for the returned parameter data. If the length is not sufficient to contain all the parameter data, the first portion of the data is returned. This is not considered an error. The actual length of the parameter data is available in the IDENTIFIER LENGTH field in the parameter data. If the remainder of the parameter data is required, the application client should send a new REPORT DEVICE IDENTIFIER command with an ALLOCATION LENGTH field large enough to contain all the data.

The REPORT DEVICE IDENTIFIER parameter list contains a 4-byte field that contains the length in bytes of the parameter list and the logical unit's identifier.

**Table 212: Report Device Identifier parameter list**

Byte	Bit							
	7	6	5	4	3	2	1	0
0-3	(MSB) Identifier Length = n - 3							(LSB)
4-n	Identifier							

The IDENTIFIER LENGTH field specifies the length in bytes of the IDENTIFIER field. If the ALLOCATION LENGTH field in the CDB is too small to transfer all of the identifier, the length is not adjusted to reflect the truncation. The identifier length initially equals zero and is changed only by a successful SET DEVICE IDENTIFIER command.

The IDENTIFIER field contains a vendor specific value. The value reported is the last value written by a successful SET DEVICE IDENTIFIER command. The value of the identifier is changed only by a SET DEVICE IDENTIFIER command. The identifier value persist through resets, power cycles, media format operations.

The Target return the same Identifier to all Initiators on all ports.

The execution of a REPORT DEVICE IDENTIFIER requires the enabling of a nonvolatile memory within the logical unit. If the nonvolatile memory is not ready, the device server returns **Check Condition** status rather than wait for the device to become ready. The sense key is set to *Not Ready* and the additional sense data is set as described in the TEST UNIT READY command. This information should allow the application client to determine the action required to cause the device server to become ready.

## 19.31 REPORT LUNS (A0)

Table 213: REPORT LUNS (A0)

Byte	Bit							
	7	6	5	4	3	2	1	0
0	Command Code = A0h							
1-5	Reserved							
6-9	(MSB) Allocation Length (LSB)							
10	Reserved							
11	VU = 0		Reserved = 0				FLAG	LINK

The REPORT LUNS command requests that the Target return the known LUN to the Initiator. The REPORT LUNS command should always be available and is unaffected by any reservations.

The Allocation Length must be at least 16 bytes. If the Allocation Length is less than 16 bytes, the Target will return a **Check Condition** status with sense key of *Illegal Request* and additional sense code of *Invalid Field in CDB*. If the Allocation Length is not sufficient to contain the LUN values for all configured logical units, the Target shall report as many LUN values as will fit in the specified Allocation Length. This is not considered an error.

The REPORT LUNS command will send the LUN list in the subsequent Data Out Phase. The format of the LUN list is shown in the following table.

Table 214: LUN Reporting parameter list format

Byte	Bit							
	7	6	5	4	3	2	1	0
0-3	(MSB) LUN List Length = 8 (LSB)							
4-7	Reserved							
8-15	(MSB) LUN = 0 (LSB)							

The LUN list length shall contain the length in bytes of the LUN list that is available to be transferred. This product only supports one LUN. Therefore, the LUN list length must be set to 8. The only supported LUN is zero.

## 19.32 REPORT SUPPORTED OPERATION CODES (A3/0C)

Byte	Bit							
	7	6	5	4	3	2	1	0
0	Command Code = A3h							
1	Reserved = 0				Service Action = 0Ch			
2	Reserved = 0					Reporting Options		
3	Requested Operation Code							
4-5	Requested Service Action							
6-9	Allocation Length							
10	Reserved = 0							
11	VU = 0		Reserved = 0				FLAG	LINK

The REPORT SUPPORTED OPERATION CODES command requests information on commands that the drive supports. The initiator may request a list of all operation codes and service actions supported, or the command support data for a specific command.

**Reporting Options** specifies the information to be returned in the parameter data.

Reporting Options	Description
000b	A list of all operation codes and service actions supported by the drive will be returned in the all_commands parameter data format. The Requested Operation Code field and Requested Service Action field will be ignored.
001b	The command support data for the operation code specified in the Requested Operation Code field will be returned in the one_command parameter data format. The Requested Service Action field will be ignored. If the Requested Operation Code field specifies an operation code that has service actions, Check Condition status will be reported with a sense key of Illegal Request and additional sense code of Invalid Field in CDB.
010b	The command support data for the operation code and service action specified in the Requested Operation Code field and Requested Service Action field will be returned in the one_command parameter data format. If the Requested Operation Code field specifies an operation code that does not have service actions, Check Condition status will be reported with a sense key of Illegal Request and additional sense code of Invalid Field in CDB.
011b-111b	Reserved

**Requested Operation Code** specifies the operation code of the command to be returned in the one\_command parameter data format.

**Requested Service Action** specifies the service action of the command to be returned in the one\_command parameter data format.

**Allocation Length** specifies the number of bytes that have been allocated for the returned parameter data. If the length is not sufficient to contain all the parameter data, the first portion of the data shall be returned. The actual length of the parameter data may be determined from the Additional Length field in the parameter data.

### 19.32.1 All\_commands parameter data format

The Report Supported Operation Codes all\_command parameter data format begins with a four-byte header that contains the length in bytes of the parameter data, followed by a list of supported commands. Each command descriptor contains information about a single supported command CDB (i.e. one operation code and service action combination, or one non-service-action operation code).

Byte	Bit							
	7	6	5	4	3	2	1	0
0-3	Command Data Length (n-3)							
4	Command Descriptor 0							
N	Command Descriptor X							

Each **Command Descriptor** contains information about a single supported command CDB.

Byte	Bit							
	7	6	5	4	3	2	1	0
0	Operation Code							
1	Reserved = 0							
2-3	Service Action							
4	Reserved = 0							
5	Reserved = 0							SERVACTV
6-7	CDB Length							

**Operation Code** contains the operation code of a supported command.

**Service Action** contains a supported service action of the supported operation. If the operation code does not have a service action, the Service Action field will be set to zero.

**SERVACTV** set to zero indicates the operation code does not have service actions and the Service Action field should be ignored. **SERVACTV** set to one indicates the operation code field has service actions and the contents of the Service Action field are valid.

**CDB Length** contains the length of the command CDB in bytes.

## 19.32.2 One\_command parameter data format

The Report Supported Operation Codes one\_command parameter data format contains information about the CDB and a usage map for bits in the CDB for the command specified by the Reporting Options, Requested Operation Code, and Requested Service Action fields in the Reported Supported Operation Codes CDB.

Byte	Bit							
	7	6	5	4	3	2	1	0
0	Reserved = 0							
1	Reserved = 0					Support		
2-3	CDB Size (n-3)							
4-n	CDB Usage Data							

The **Support** field is defined in the table below.

Recording Option	Description
000b	Data about the requested command is not currently available. All data after byte 1 is not valid. A subsequent request for command support data may be successful.
001b	The requested command is not supported. All data after byte 1 is not valid.
010b	Reserved.
011b	The requested command is supported in conformance with the standard.
100b	Reserved
101b	The requested command is supported in a vendor specific manner.
110b-111b	Reserved.

**CDB Size** contains the size of the CDB Usage Data field in the parameter data, and the number of bytes in the CDB for the command requested.

**CDB Usage Data** contains information about the CDB for the command requested. The first byte of the CDB Usage Data field contains the operation code for the command. If the command contains a service action, then that service action code is returned in the same location as the Service Action field of the command CDB. All other bytes of the CDB Usage Data field contain a usage map for bits in the CDB for the command requested.

The bits in the usage map have a one-for-one correspondence to the CDB for the command requested. If the drive evaluates a bit in the CDB, the usage map will contain a one in the corresponding bit position. The usage map will contain a zero in the corresponding bit position for any field treated as ignored or reserved.

## 19.33 REPORT SUPPORTED TASK MANAGEMENT FUNCTIONS (A3/0D)

Table 215: Report Supported Tasks Management Functions (A3/0D)

Byte	Bit							
	7	6	5	4	3	2	1	0
0	Command Code = A3h							
1	Reserved = 0			Service Action = 0Dh				
2-5	Reserved = 0							
6-9	Allocation Length							
10	Reserved = 0							
11	VU = 0		Reserved = 0				Flag	Link

The REPORT SUPPORTED TASK MANAGEMENT FUNCTIONS command requests information on task management functions supported by the drive.

**Allocation Length** specifies the number of bytes that have been allocated for the returned parameter data. The allocation length must be at least four. If the allocation length is less than four, Check Condition Status will be returned with sense key of Illegal Request and additional sense code of Invalid Field in CDB.

The format of the returned parameter data is shown below.

Byte	Bit							
	7	6	5	4	3	2	1	0
0	ATS	ATSS	CACAS	CTSS	LURS	QTS	TRS	WAKES
1-3	Reserved = 0							

**ATS (Abort Task)** bit set to one indicates that ABORT TASK is supported. An ATS bit of zero indicates that ABORT TASK is not supported.

**ATSS (Abort Task Set)** bit set to one indicates that ABORT TASK SET is supported. An ATSS bit of zero indicates that ABORT TASK SET is not supported.

**CACAS (Clear ACA)** bit set to one indicates that CLEAR ACA is supported. A CACAS bit of zero indicates that CLEAR ACA is not supported.

**CTSS (Clear Task Set)** bit set to one indicates that CLEAR TASK SET is supported. A CTSS bit of zero indicates that CLEAR TASK SET is not supported.

**LURS (Logical Unit Reset)** bit set to one indicates that LOGICAL UNIT RESET is supported. An LUR bit of zero indicates that LOGICAL UNIT RESET is not supported.

**QTS (Query Task)** bit set to one indicates that QUERY TASK is supported. A QTS bit of zero indicates that QUERY TASK is not supported.

**TRS (Target Reset)** bit set to one indicates that TARGET RESET is supported. A TRS bit of zero indicates that TARGET RESET is not supported.

**WAKES (Wakeup)** bit set to one indicates that WAKEUP is supported. A WAKES bit of zero indicates that WAKEUP is not supported.

## 19.34 REQUEST SENSE (03)

Table 216: REQUEST SENSE (03)

Byte	Bit							
	7	6	5	4	3	2	1	0
0	Command Code = 03h							
1	Reserved = 0			Reserved = 0				
2-3	Reserved = 0							
4	Allocation Length							
5	VU = 0		Reserved = 0				FLAG	LINK

The REQUEST SENSE command requests the drive to transfer sense data.

If REQUEST SENSE command with an invalid LUN is received, the drive returns **Good** status and reports a sense key of *Illegal Request* and an additional sense code of *Logical Unit Not Supported*.

If the drive has no sense data available to return, it shall return a sense key of *No Sense* and an additional sense code of *No Additional Sense Information*.

Separate sense data is maintained by the device for each Initiator. Therefore, there is no requirement for an Initiator to expeditiously clear a *Check Condition* as this will not affect other initiators in a multi-Initiator system.

The drive will return the number of bytes in the allocation length or 32 bytes, whichever is less.

## 19.35 RESERVE (16)

Table 217: RESERVE (16)

Byte	Bit							
	7	6	5	4	3	2	1	0
0	Command Code = 16h							
1	Reserved = 0		3rdPty=0	3rd Party ID			Ext=0	
2	Reservation Identification							
3-4	(MSB) Extent List Length = 0 (LSB)							
5	VU = 0		Reserved = 0			FLAG	LINK	

The RESERVE command is used to reserve a LUN for an Initiator. This reservation can be either for the Initiator sending the command or for a third party as specified by the Initiator.

Extents are not supported by the drive. The Ext bit must be zero. If Ext bit is set to one, **Check Condition** status is returned with a sense key of *Illegal Request* and additional sense code of *Invalid Field in CDB*. The Reservation Identification and Extent List Length fields are ignored.

The Reserve command requests that the entire LUN be reserved for the Initiator until

- the reservation is superseded by another valid Reserve command from the Initiator that made the reservation.
- the reservation is released by a RELEASE command from the same Initiator.
- a hard Reset condition occurs.
- a Target Reset message is received from any Initiator.
- a power off/on cycle occurs.

**3rdPty** must be 0. Third Party reservations are not supported. If the 3rdPty bit is not zero, Check Condition status is returned with a sense key of *Illegal Request* and additional sense code of *Invalid Field in CDB*.

**3rd Party ID** is ignored.

Only the Initiator that issued the Reserve command for a LUN may release the LUN, regardless of the 3rdPty option. This Initiator may also release the LUN by issuing another RESERVE command. This superseding RESERVE command releases the previous reservation when the new reservation is granted.

Reservation queuing is not supported by the drive. If a LUN is reserved and a RESERVE command is issued from a different Initiator, the Target responds with a RESERVATION CONFLICT.

## 19.36 RESERVE (56)

Table 218: RESERVE (56)

Byte	Bit							
	7	6	5	4	3	2	1	0
0	Command Code = 56h							
1	Reserved = 0		3rdPty=0		Reserved		Ext=0	
2	Reservation Identification							
3	Third Pay Device ID							
4-6	Reserved = 0							
7-8	(MSB) Extent List Length = 0							(LSB)
9	VU = 0		Reserved = 0			FLAG	LINK	

The RESERVE command is used to reserve a LUN for an Initiator. This reservation can be either for the Initiator sending the command or for a third party as specified by the Initiator.

Extents are not supported by the drive. The Ext bit must be zero. If Ext bit is set to one, **Check Condition** status is returned with a sense key of *Illegal Request* and additional sense code of *Invalid Field in CDB*. The Reservation Identification and Extent List Length fields are ignored.

The Reserve command requests that the entire LUN be reserved for the Initiator until

- the reservation is superseded by another valid Reserve command from the Initiator that made the reservation.
- the reservation is released by a RELEASE command from the same Initiator.
- a hard Reset condition occurs.
- a Target Reset message is received from any Initiator.
- a power off/on cycle occurs.

**3rdPty** must be 0. Third Party reservations are not supported. If the 3rdPty bit is not zero, Check Condition status is returned with a sense key of *Illegal Request* and additional sense code of *Invalid Field in CDB*.

**3rd Party ID** is ignored.

Only the Initiator that issued the Reserve command for a LUN may release the LUN, regardless of the 3rdPty option. This Initiator may also release the LUN by issuing another RESERVE command. This superseding RESERVE command releases the previous reservation when the new reservation is granted.

Reservation queuing is not supported by the drive. If a LUN is reserved and a RESERVE command is issued from a different Initiator, the Target responds with a RESERVATION CONFLICT.

## 19.37 REZERO UNIT (01)

Table 219: REZERO UNIT (01)

Byte	Bit							
	7	6	5	4	3	2	1	0
0	Command Code = 01h							
1	Reserved = 0			Reserved = 0				
2-4	Reserved = 0							
5	VU = 0		Reserved = 0				FLAG	LINK

The REZERO UNIT command requests that the Target seek LBA 0.

## 19.38 SEEK (6) - (0B)

Table 220: SEEK (6) - (0B)

Byte	Bit							
	7	6	5	4	3	2	1	0
0	Command Code = 0Bh							
1	Reserved = 0			(MSB) LBA				
2	Logical Block Address (LSB)							
3								
4	Reserved = 0							
5	VU = 0		Reserved = 0				FLAG	LINK

The SEEK (6) command requests the drive to seek the specified LBA. If the LBA is greater than the value returned by the READ CAPACITY command, the Drive returns a **Check Condition** status with a sense key of *Illegal Request* and an additional sense code of *Invalid Field in CDB*.

## 19.39 SEEK (10) - (2B)

Table 221: SEEK (10) - (2B)

Byte	Bit							
	7	6	5	4	3	2	1	0
0	Command Code = 2Bh							
1	Reserved = 0			Reserved = 0				0
2-5	(MSB) Logical Block Address (LSB)							
6-8	Reserved = 0							
9	VU = 0		Reserved = 0				FLAG	LINK

The SEEK (10) command requests the drive to seek the specified LBA. If the LBA is greater than the value returned by the READ CAPACITY command, the Drive returns a **Check Condition** status with a sense key of *Illegal Request* and an additional sense code of *Invalid Field in CDB*.

## 19.40 SEND DIAGNOSTIC (1D)

Table 222: SEND DIAGNOSTIC (1D)

Byte	Bit							
	7	6	5	4	3	2	1	0
0	Command Code = 1Dh							
1	Function Code			PF	RSVD =0	SIfTst	Dev0fl	Unt0fl
2	Reserved = 0							
3-4	(MSB) Parameter List Length							(LSB)
5	VU = 0		Reserved = 0				FLAG	LINK

The SEND DIAGNOSTIC command requests the drive to perform its self-diagnostic test or to perform a function based on a page of information sent in a Data Out phase during the command.

- **PF (Page Format)** bit set to one indicates the data sent by the Initiator conform to the page structure as specified in SCSI standard. This bit is ignored by the Target if the SIfTst bit is set.
- **SIfTst** set to one indicates that the device performs its default self-test. If SIfTst is one, the Function code field is ignored. If SIfTst is set to zero, the action to perform is specified in Function code field.

**Table 223: SEND DIAGNOSTIC Function Code (1D)**

Value	Function name	Description
000b	NA	Value to be used when the SlfTst bit is set to one or if the SEND DIAGNOSTIC command is not invoking one of the other self-test function codes.
001b	Background Short self-test	The device server starts its short self-test routine in background mode.
010b	Background extended self-test	The device server starts its extended self-test routine in background mode.
011b	NA	Reserved.
100b	Abort background self-test	Abort the current self-test in the background mode. This value is only valid if a previous SEND DIAGNOSTIC command specified a background self-test function and that function has not been completed.
101b	Foreground short self-test	The device server starts its short self-test routine in the foreground mode. This self-test will complete in two minutes or less.
110b	Foreground extended self-test	The device server starts its extended self-test routine in the foreground mode. The completion time for this test is reported in Mode Page 0Ah (refer to Mode Page 0A (Control Mode Page Parameters)*, page 186).
111b		Reserved.

- **DevOff** is ignored by the Target for compatibility.
- **UntOff** is ignored by the Target for compatibility.
- **Parameter List Length** must be 0 when the SlfTst bit is one. Otherwise, **Check Condition** status will be generated with a sense key of *Illegal Request* and additional sense of *Invalid Field in CDB*. If the SlfTst bit is zero, it should be set to the length of the page to be transferred in the DATA OUT phase of the command. If it does not match the expected length of the page a **Check Condition** status will be also generated with a sense key of *Illegal Request* and additional sense of *Invalid Field in CDB*.

If the motor is not running at the correct speed when the command is received, it is rejected by a **Check Condition** status with a *Not Ready* sense key.

If a fault is detected during the default or foreground self-test, a **Check Condition** is reported as an end status. If a fault is detected during the background self-test, it is logged in the log page for later retrieval by a LOG SENSE command.

See Section Diagnostics\*, page 333 for a detailed listing of operations carried out by the SEND DIAGNOSTIC command and Power on Diagnostics.

## 19.40.1 Send Diagnostic Page 0

This page requests that the drive return a list of supported pages on the next RECEIVE DIAGNOSTICS command.

**Table 224: Diagnostic Page 0**

Byte	Bit							
	7	6	5	4	3	2	1	0
0	Page Code = 0							
1	Reserved = 0							
2 - 3	Page Length = 0							

## 19.40.2 Send Diagnostic Page 40

This allows the Initiator to translate a LBA or physical sector address to the other format. The address to be translated is passed to the Target with the SEND DIAGNOSTIC command and the results are returned to the Initiator by the RECEIVE DIAGNOSTICS command.

The Target will read the parameter list from the Initiator, and, if no errors are detected in the parameter list, **Good** status will be returned. The data translation will be performed upon receipt of the RECEIVE DIAGNOSTICS command.

**Table 225: Diagnostic Page 40**

Byte	Bit							
	7	6	5	4	3	2	1	0
0	Page Code = 40h							
1	Reserved = 0							
2-3	Page Length = 0Ah							
4	Reserved = 0					Supplied format		
5	Reserved = 0					Translate format		
6-13	Address to Translate							

**Supplied Format** may take one of the following three values:

- **000b** Block format
- **100b** Bytes From Index format
- **101b** Physical Sector format

It specifies the format in which the address has been supplied.

- **Translate Format** specifies the format that the address should be translated into. If the supplied format is the Block format, the Translate format must be either Bytes from Index or Physical Sector format. If the supplied format is the Bytes from Index or Physical Sector format, the Translate format must be Block format. If either of the format fields is invalid or they specify the same format, the command will terminate with **Check Condition** status with a sense code of *Illegal Request* and *Illegal Field in Parameter List*.

- **Address to Translate** contains the address to translate. If the logical block format is specified, the first four bytes of the field (bytes 6 to 9) contain the LBA and the remainder must be zero. For the physical format the address must be specified as follows.

**Table 226: Address to translate**

Byte	Bit							
	7	6	5	4	3	2	1	0
6-8	Cylinder Number							
9	Head Number							
10-13	Sector Number or Bytes from Index							

### 19.40.3 Send Diagnostic Page A0h

The Device LED Control Page A0h allows the initiator to turn on or off the device fault LED light.

**Table 227: Device LED Control Page - Send Diagnostic**

Byte	Bit							
	7	6	5	4	3	2	1	0
0	Page Code = A0h							
1	Reserved = 0							
2-3	(MSB) Page Length = 0002h							(LSB)
4	Reserved = 0							
5	Reserved = 0							SBDL

The page begins with a four-byte page header which specifies the page code and length. A SBDL (Set Bad Device Light) bit of one turns the device LED on, zero turns the device LED off. If the target detects an error in the passed parameter data it shall terminate the command with CHECK CONDITIONS Status. The sense key shall be set to Illegal Request and the Additional Sense code set to Illegal Field in CDB.

## 19.41 SET DEVICE IDENTIFIER (A4/06)

Table 228: SET DEVICE IDENTIFIER (A4/06)

Byte	Bit							
	7	6	5	4	3	2	1	0
0	Command Code = A4h							
1	Reserved = 0				Service Action = 06h			
2	Reserved = 0							
3	Reserved = 0							
4-5	Restricted = 0							
6-9	(MSB) Parameter List Length (LSB)							
10	Reserved = 0							
11	VU = 0		Reserved = 0				FLAG	LINK

The SET DEVICE IDENTIFIER command requests that the device identifier information be set to the value received in the SET DEVICE IDENTIFIER parameter list.

On successful completion of a SET DEVICE IDENTIFIER command a unit attention is generated for all Initiators except the one that issued the service action. When reporting the unit attention condition the additional sense code is set to *Device Identifier Changed*.

- **Parameter List Length** field specifies the length in bytes of the Identifier that is transferred from the host system to the Target. The maximum value for this field is 512 bytes. A parameter list length of zero indicates that no data is transferred, and that subsequent REPORT DEVICE IDENTIFIER commands return an Identifier length of zero.

The SET DEVICE IDENTIFIER parameter list contains the identifier to be set by the addressed logical unit.

Table 229: SET DEVICE IDENTIFIER, Parameter List

Byte	Bit							
	7	6	5	4	3	2	1	0
0-n	Identifier							

The IDENTIFIER field is a vendor specific value, to be returned in subsequent REPORT DEVICE IDENTIFIER commands.

## 19.42 START STOP UNIT (1B)

Table 230: START STOP UNIT (1B)

Byte	Bit							
	7	6	5	4	3	2	1	0
0	Command Code = 1Bh							
1	Reserved = 0			Reserved = 0				Immed
2-3	Reserved = 0							
4	Power Conditions = 0			Reserved=0			LoEj = 0	Start
5	VU = 0	Reserved = 0				FLAG	LINK	

The START STOP UNIT command is used to spin up or stop the spindle motor.

- **Immed** bit is to specify
  - 0** status is to be returned at the end of the operation.
  - 1 Good** status shall always be returned immediately after command has been received. The TEST UNIT READY command may be used to determine when the drive becomes ready after a spin-up.
- **Power Conditions** is not supported by the drive and must be set to 0.
- **LoEj** is not supported by the drive and must be set to 0.
- **Start** bit is to specify:
  - 0** stop the spindle
  - 1** start the spindle

**Note:** Once the drive has become ready (after a power on), the START STOP UNIT command can be used without any errors regardless of the state of the motor: stopped or spinning.

## 19.43 SYNCHRONIZE CACHE (10) - (35)

Table 231: SYNCHRONIZE CACHE (10) - (35)

Byte	BIT							
	7	6	5	4	3	2	1	0
0	Command Code = 35h							
1	Reserved = 0			Reserved = 0			Immed = 0	Obsolete
2-5	(MSB) Logical Block Address (LSB)							
6	Reserved = 0							
7-8	(MSB) Number of Blocks (LSB)							
9	VU = 0	Reserved = 0				FLAG	LINK	

The SYNCHRONIZE CACHE command ensures that logical blocks in the cache have their most recent data value recorded on the media.

- **Logical Block Address** is to specify where the operation is to begin.
- **Immed** (immediate) must be zero. An immediate bit of zero indicates that the status shall not be returned until the operation has completed. If the Immed bit is set to one, the drive returns a **Check Condition** status. The sense key shall be set to *Illegal Request* and the additional sense code shall be set to *Invalid Field in CDB*.
- **Number of Blocks** specifies the total number of contiguous logical blocks within the range. Number of Blocks of zero indicates that all remaining logical blocks on the logical unit shall be within the range.

## 19.44 SYNCHRONIZE CACHE (16) - (91)

Table 232: Synchronize Cache (16) - (91)

Byte	BIT							
	7	6	5	4	3	2	1	0
0	Command Code = 91h							
1	Reserved = 0						Immed = 0	Rsvd = 0
2-9	Logical Block Address							
10-13	Number of Blocks							
14	Reserved = 0							
15	VU = 0		Reserved = 0				FLAG	LINK

The SYNCHRONIZE CACHE command ensures that logical blocks in the cache have their most recent data value recorded on the media. See the SYNCHRONIZE CACHE (10) description for definitions of the fields in this command.

## 19.45 TEST UNIT READY (00)

Table 233: TEST UNIT READY (00)

Byte	Bit							
	7	6	5	4	3	2	1	0
0	Command Code = 00h							
1	Reserved = 0			Reserved = 0				
2-4	Reserved = 0							
5	VU = 0		Reserved = 0			FLAG		LINK

The TEST UNIT READY command allows the Initiator to check if the drive is READY. The SCSI specification defines READY as the condition where the device will accept a media-access command without returning **Check Condition** status.

The drive will first verify that the motor is spinning at the correct speed. If the spindle motor is not spinning at the correct speed, **Check Condition** status is returned with sense key of *Not Ready*. If the motor is spinning at the correct speed, the drive accepts normal media access commands.

The TEST UNIT READY command is not intended as a diagnostic. No self diagnostic is performed by the device as a result of this command.

The TEST UNIT READY command has special significance for power sequencing using the UNIT START command with an Immediate bit of one. In this mode the UNIT START command returns **Task Complete** status before the completion of motor spin-up and expects the initiator to issue TEST UNIT READY commands to determine when the motor has reached the proper speed.

**Note:** The spindle automatically starts in automatic spin-up mode. The drive does not execute any commands other than TEST UNIT READY, INQUIRY, or REQUEST SENSE command until the Power On sequence is complete. The drive will return **Check Condition** status with *Not Ready* sense key and *In Process of Becoming Ready* sense code for all other commands during the Power On period.

## 19.46 VERIFY (2F)

Table 234: VERIFY (2F)

Byte	BIT							
	7	6	5	4	3	2	1	0
0	Command Code = 2Fh							
1	VRPROTECT		DPO	Reserved = 0			Byte Chk	RSVD = 0
2-5	(MSB) Logical Block Address (LSB)							
6	Reserved = 0							
7-8	(MSB) Verification Length (LSB)							
9	VU = 0		Reserved = 0			FLAG	LINK	

The VERIFY command requests that the drive verify the data written on the media. A verification length of zero indicates that no data will be transferred. This condition is not considered an error.

- **ByteChk** bit set to zero indicates that the data is read from the disk and verified using ECC. If an ECC error is detected in the verify process, **Check Condition** status is returned with sense key set to *Medium Error*. ByteChk bit set to one indicates that byte-by-byte comparison is performed between the data on the disk and data transferred from the initiator during the data-out phase.  
If the comparison is unsuccessful, the command is terminated with **Check Condition** status and the sense key is set to *Miscompare*.
- **DPO** (Disable Page Out) bit of one indicates that the data accessed by this command is to be assigned the lowest priority for being written into or retained by the cache. A DPO bit of one overrides any retention priority specified in the Mode Select Page 8 Caching Parameters. A DPO bit of zero indicates the priority is determined by the retention priority. The Initiator should set the DPO bit when the blocks read by this command are not likely to be read again in the near future.

If caching is enabled, the command performs an implied FUA and an implied Synchronize Cache before starting the VERIFY. This ensures that the medium, not the cache, is being verified.

The command stops on *Check Condition* and reports the LBA in error. The command must be reissued, starting with the next LBA, to verify the remainder of the Drive.

The Verification Length is the number of blocks to check.

The data (if any) from the data-out phase and the data from the media are not retained in the cache. Therefore, the DPO bit has no effect on this command and is ignored.

VRPROTECT defines the manner in which protection information read from disk shall be checked during processing of the command. Protection information is stored on disk, and may be validated using the drive's internal checking algorithms, and also byte-by-byte compared using data from the initiator when ByteChk=1.

If the drive is not formatted with protection information, VRPROTECT must be set to 000b, else Check Condition status will be returned with sense key of Illegal Request and additional sense code of Invalid Field in CDB.

VRPROTECT=000b

If the drive is not formatted with protection information, only user data is verified.

If the drive is formatted with protection information:

- Logical Block Guard is checked
- Logical Block Application Tag is checked (applies to VERIFY(32) command only)
- Logical Block Reference Tag is checked

VRPROTECT=001b

- Logical Block Guard is checked
- Logical Block Application Tag is checked (applies to VERIFY(32) command only)
- Logical Block Reference Tag is checked

VRPROTECT=010b

- Logical Block Guard is not checked
- Logical Block Application Tag is checked (applies to VERIFY(32) command only)
- Logical Block Reference Tag is checked

VRPROTECT=011b

- Logical Block Guard is not checked
- Logical Block Application Tag is not checked
- Logical Block Reference Tag is not checked

VRPROTECT=100b

- Logical Block Guard is checked
- Logical Block Application Tag is not checked
- Logical Block Reference Tag is not checked

VRPROTECT=101b, 110b, 111b

These values are reserved. Check Condition status will be returned with sense key of Illegal Request and additional sense code of Invalid Field in CDB.

If a check of the protection information fails, Check Condition status will be returned with sense key of Aborted Command and additional sense code indicating which protection field check failed.

If ByteChk=1, the drive's internal checking of protection information is done only when VRPROTECT=000b and the drive is formatted with protection information

If ByteChk=1, and VRPROTECT is not set to 000b, checking of protection information is performed on the fields described above as a byte-by-byte comparison against the data transferred to the drive by the initiator during the Data Out phase..

Refer to the ANSI T10 standards for additional details of protection information.

## 19.47 VERIFY (12) - (AF)

Table 235: Verify (12) - (AF)

Byte	BIT							
	7	6	5	4	3	2	1	0
0	Command Code = AFh							
1	VRPROTECT		DPO	FUA	Reserved=0	Byte Chk	Reserved = 0	
2-5	(MSB) Logical Block Address (LSB)							
6 - 9	(MSB) Verification Length (LSB)							
10	Reserved = 0							
11	VU = 0		Reserved = 0			FLAG	LINK	

The VERIFY(12) command causes the drive to verify data written on the media. See the VERIFY(10) description for the definitions of the fields in this command.

## 19.48 VERIFY (16) - (8F)

Table 236: Verify (16) - (8F)

Byte	Bit							
	7	6	5	4	3	2	1	0
0	Command Code = 08Fh							
1	VRPROTECT		DPO	Reserved = 0			Byte Chk	Rsvd = 0
2-9	(MSB) Logical Block Address							(LSB)
10-13	(MSB) Verification Length							(LSB)
14	Reserved = 0							
15	VU = 0		Reserved = 0			FLAG	LINK	

The VERIFY command requests that the drive verify the data written on the media. See the VERIFY (10) description for the definitions of the fields in this command.

## 19.49 VERIFY (32) - (7F/0A)

Table 237: Verify (32) - 7F/0A)

Byte	Bit							
	7	6	5	4	3	2	1	0
0	Command Code = 0FFh							
1	VU = 0		Reserved = 0				FLAG	LINK
2-5	Reserved = 0							
6	Reserved = 0			Group Number = 0				
7	Additional CDB Length = 18h							
8 - 9	Service Action = 000Ah							
10	RDPROTECT			DPO	Reserved = 0		ByteC hk	Reserv ed=0
11	Reserved = 0							
12 - 19	(MSB) Logical Block Address (LSB)							
20 - 23	(MSB) Expected Initial Logical Block Reference Tag (LSB)							
24 - 25	(MSB) Expected Logical Block Application Tag (LSB)							
26 - 27	(MSB) Logical Block Application Tag Mask (LSB)							
28 - 31	(MSB) Verification Length (LSB)							

The VERIFY command requests that the verify the data written on the media. Each logical block includes user data and may include protection information, based on the VPROTECT field and the drive format.

If the RTO\_EN bit is set to zero in the READ CAPACITY (16) parameter data, Check Condition status will be returned with sense key of Illegal Request and additional sense code of Invalid Command Operation Code. If RTO\_EN is one, this command will be processed normally.

See VERIFY (2F) for descriptions of the VPROTECT, DPO, ByteChk, Logical Block Address, and Verification Length fields.

When checking of the Logical Block Reference Tag field is enabled, the Expected Initial Logical Block Reference Tag field contains the value of the Logical Block Reference Tag field expected in the protection information of the first logical block accessed by the command, instead of a value based on the LBA.

If the ATO bit is set to one in Mode Page 0A and checking of the Logical Block Application Tag field is enabled, the Logical Block Application Tag Mask field contains a value that is a bit mask for enabling the checking of the Logical Block Application Tag field in the protection information for each logical block accessed by the command. A Logical Block Application Tag Mask bit set to one enables the checking of the corresponding bit of the Expected Logical Block Application Tag field with the corresponding bit of the Logical Block Application Tag field in the protection information.

If the ATO bit is set to one in Mode Page 0A and the checking of the Logical Block Application Tag field is disabled, or if the ATO bit is set to zero, the Logical Block Application Tag Mask field and the Expected Logical Block Application Tag field are ignored.

## 19.50 WRITE (6) - (0A)

Table 238: WRITE (6) - (0A)

Byte	Bit								
	7	6	5	4	3	2	1	0	
0	Command Code = 0Ah								
1	Reserved = 0			(MSB) LBA					
2-3	Logical Block Address (LSB)								
4	Transfer Length								
5	VU = 0		Reserved = 0				FLAG	LINK	

The WRITE command requests the drive to write the specified number of blocks of data (**Transfer Length**) from the Initiator to the medium starting at the specified **Logical Block Address (LBA)**.

See Section 19.15 “READ (6) - (08)” on page 208 for the parameters.

## 19.51 WRITE (10) - (2A)

Table 239: WRITE (10) - (2A)

Byte	Bit							
	7	6	5	4	3	2	1	0
0	Command Code = 2Ah							
1	WRPROTECT			DPO	FUA	Rsvd=0	FUA_NV	Obsolete
2-5	(MSB) Logical Block Address (LSB)							
6	Reserved = 0							
7-8	(MSB) Transfer Length (LSB)							
9	VU = 0	Reserved = 0				FLAG	LINK	

The WRITE (10) command requests that the drive write the data transferred from the Initiator. This command is processed like the standard WRITE (6) - (0A) command except for the longer transfer length.

- **Transfer Length** is the number of contiguous blocks to be transferred. If the transfer length is zero, the seek occurs, but no data is transferred. This condition is not considered an error.
- **DPO** (Disable Page Out) bit of one indicates that the data accessed by this command is to be assigned the lowest priority for being written into or retained by the cache. A DPO bit of one overrides any retention priority specified in the Mode Select Page 8 Caching Parameters. A DPO bit of zero indicates that the priority is determined by the retention priority. The Initiator should set the DPO bit when the blocks written by this command are not likely to be read in the near future.
- **FUA** (Force Unit Access) bit of one indicates that the Target must write the data to the media before returning **Good** status. A FUA bit of zero indicates that the Target may return **Good** status prior to writing the data to the media.
- **FUA\_NV** (Force Unit Access Non-Volatile Cache) may be set to 0 or 1, but is ignored since NV\_SUP=0 in Inquiry Page 86h.

If a WRITE(6) command is received after protection information is enabled, the drive will set the protection information as follows as it writes each block to disk:

- the Logical Block Guard field is set to a properly generated CRC
- the Logical Block Reference Tag field is set to:
- the least significant four bytes of the LBA, if the RTO\_EN bit is set to zero in the READ CAPACITY (16) parameter data ; or
- FFFFFFFFh, if the RTO\_EN bit is set to one;
- the Logical Block Application Tag field is set to
- FFFFh, if the ATO bit is set to one in Mode Page 0Ah
- Any value, if the ATO bit is set to zero.

**WRPROTECT** defines the manner in which protection information written to disk shall be checked during processing of the command. Protection information may be transmitted to the drive with the user data, based on the WRPROTECT bit and the drive format.

If the drive is not formatted with protection information, WRPROTECT must be set to 000b, else **Check Condition** status will be returned with sense key of Illegal Request and additional sense code of Invalid Field in CDB.

WRPROTECT=000b

Protection information is not transmitted to the drive.

If the drive is formatted with protection information, the drive will write protection information to disk based on its internal algorithms.

WRPROTECT=001b

- Protection information is transmitted to the drive with the user data
- Logical Block Guard is checked
- Logical Block Application Tag is checked (applies to WRITE (32) command only)
- Logical Block Reference Tag is checked

WRPROTECT=010b

- Protection information is transmitted to the drive with the user data
- Logical Block Guard is not checked
- Logical Block Application Tag is checked (applies to WRITE(32) command only)
- Logical Block Reference Tag is checked

WRPROTECT=011b

- Protection information is transmitted to the drive with the user data
- Logical Block Guard is not checked
- Logical Block Application Tag is not checked
- Logical Block Reference Tag is not checked

WRPROTECT=100b

- Protection information is transmitted to the drive with the user data
- Logical Block Guard is checked
- Logical Block Application Tag is not checked
- Logical Block Reference Tag is not checked

WRPROTECT=101b, 110b, 111b

These values are reserved. Check Condition status will be returned with sense key of Illegal Request and additional sense code of Invalid Field in CDB.

If a check of the protection information fails, Check Condition status will be returned with sense key of Aborted Command and additional sense code indicating which protection field check failed.

Refer to the ANSI T10 standards for additional details of protection information.

## 19.52 WRITE (12) - (AA)

Table 240: Write (12) - (AA)

Byte	Bit							
	7	6	5	4	3	2	1	0
0	Command Code = AAh							
1	WRPROTECT			DPO	FUA	Rsvd=0	FUA_NV	Rsvd=0
2-5	(MSB) Logical Block Address (LSB)							
6-9	(MSB) Transfer Length (LSB)							
10	Reserved=0							
11	VU = 0		Reserved = 0				FLAG	LINK

## 19.53 WRITE (16) - (8A)

Byte	Bit							
	7	6	5	4	3	2	1	0
0	Command Code = 8Ah							
1	WRPROTECT			DPO	FUA	Rsvd=0	FUA_NV	Rsvd=0
2-9	(MSB) Logical Block Address (LSB)							
10-13	(MSB) Transfer Length (LSB)							
14	Reserved = 0							
15	VU = 0		Reserved = 0			FLAG		LINK

The WRITE(16) command causes the drive to write data from the initiator to the media. See the WRITE(10) description for the definitions of the fields in this command.

## 19.54 WRITE (32) - (7F/0B)

Table 241: Write (32) - (7F/0B)

Byte	Bit							
	7	6	5	4	3	2	1	0
0	Command Code = 7Fh							
1	VU = 0		Reserved = 0				FLAG	LINK
2-5	Reserved = 0							
6	Reserved = 0			Group Number = 0				
7	Additional CDB Length = 18h							
8-9	Service Action = 0009h							
10	WRPROTECT			DPO	FUA	Rsvd=0	FUA_NV	Rsvd=0
11	Reserved = 0							
12-19	(MSB)	Logical Block Address						(LSB)
20-23	(MSB)	Expected Initial Logical Block Reference Tag						(LSB)
24-25	(MSB)	Expected Logical Block Application Tag						(LSB)
26-27	(MSB)	Logical Block Application Tag Mask						(LSB)
28-31	(MSB)	Transfer Length						(LSB)

The WRITE command requests that the drive write data transferred from the initiator to disk. Each logical block transferred

includes user data and may include protection information, based on the WRPROTECT field and the drive format. Each logical block written includes user data and, if the drive is formatted with protection information enabled, protection information.

If the RTO\_EN bit is set to zero in the READ CAPACITY (16) parameter data, **Check Condition** status will be returned with sense key of Illegal Request and additional sense code of Invalid Command Operation Code. If RTO\_EN is one, this command will be processed normally.

See WRITE (10) - (2A) for descriptions of the WRPROTECT, DPO, FUA, Logical Block Address, and Transfer Length fields.

When checking of the Logical Block Reference Tag field is enabled, the Expected Initial Logical Block Reference Tag field contains the value of the Logical Block Reference Tag field expected in the protection information of the first logical block accessed by the command, instead of a value based on the LBA.

If the ATO bit is set to one in Mode Page 0A and checking of the Logical Block Application Tag field is enabled, the Logical Block Application Tag Mask field contains a value that is a bit mask for enabling the checking of the Logical Block Application Tag field in the protection information for each logical block accessed by the command. A Logical Block Application Tag Mask bit set to one enables the checking of the corresponding bit of the Expected Logical Block Application Tag field with the corresponding bit of the Logical Block Application Tag field in the protection information.

If the ATO bit is set to one in Mode Page 0A and the checking of the Logical Block Application Tag field is disabled, or if the ATO bit is set to zero, the Logical Block Application Tag Mask field and the Expected Logical Block Application Tag field are ignored.

## 19.55 WRITE AND VERIFY (10) - (2E)

Table 242: WRITE AND VERIFY (10) - (2E)

Byte	Bit							
	7	6	5	4	3	2	1	0
0	Command Code = 2Eh							
1	WRPROTECT			DPO	Reserved = 0		Byte Chk	Obsolete
2-5	(MSB) Logical Block Address (LSB)							
6	Reserved = 0							
7-8	(MSB) Transfer Length (LSB)							
9	VU = 0		Reserved = 0			FLAG	LINK	

WRITE AND VERIFY command requests that the drive writes the data transferred from the Initiator to the medium and then verify that the data is correctly written. If caching is enabled, an implied FUA (Force Unit Access) and an implied Synchronize Cache are performed before starting the operation. This insures that data from the disk, not the cache, is verified.

- See the WRITE (10) command description for the definition of the WRPROTECT field.
- **Transfer Length** is the number of contiguous blocks to be transferred. If the transfer length is zero, the seek occurs, but no data is transferred. This condition is not considered an error.

If caching is enabled, the command performs an implied FUA and an implied Synchronize Cache before starting the operation. This insures that the medium, not the cache, is being verified.

- **ByteChk** bit set to zero indicates that the data is read back from the disk and verified using ECC after the successful write operation. If an ECC error is detected in the verify process, **Check Condition** status is returned with sense key set to *Medium Error*. ByteChk bit set to one indicates that byte-by-byte comparison is performed between data on the disk starting the block specified in LBA field and data transferred from the Initiator.

If the comparison is unsuccessful, the command is terminated with **Check Condition** status and the sense key is set to *Miscompare*.

- **DPO** (Disable Page Out) bit of one indicates that the data written by this command is to be assigned the lowest priority for being written into or retained by the cache. A DPO bit of one overrides any retention priority specified in the Mode Select Page 8 Caching parameters. A DPO bit of zero indicates the priority is determined by the retention priority.

The Initiator should set the DPO bit when the blocks written by this command are not likely to be read again in the near future.

## 19.56 WRITE AND VERIFY (12) - (AE)

Table 243: Write andVerify (12) - (AE)

Byte	Bit							
	7	6	5	4	3	2	1	0
0	Command Code = AEh							
1	WRPROTECT			DPO	Reserved = 0		ByteChk	Obsolete
2-5	(MSB) Logical Block Address (LSB)							
6-9	(MSB) Transfer Length (LSB)							
10	Reserved = 0							
11	VU = 0		Reserved = 0			FLAG	LINK	

The WRITE AND VERIFY command requests that the drive write the data transferred from the Initiator to the medium and then verify that the data is correctly written. See the WRITE AND VERIFY (10) description for the definitions of the fields in this command.

## 19.57 WRITE AND VERIFY (16) - (8E)

Table 244: Write and Verify (16) - (8E)

Byte	Bit							
	7	6	5	4	3	2	1	0
0	Command Code = 8Eh							
1	WRPROTECT			DPO	Reserved = 0		Byte Chk	Obsolete
2-9	(MSB) Logical Block Address (LSB)							
10-13	(MSB) Transfer Length (LSB)							
14	Reserved = 0							
15	VU = 0		Reserved = 0			FLAG	LINK	

The WRITE AND VERIFY command requests that the drive write the data transferred from the Initiator to the medium and then verify that the data is correctly written.

## 19.58 WRITE AND VERIFY (32) - (7F/0C)

Table 245: Write and Verify (32) - (7F/0C)

Byte	Bit							
	7	6	5	4	3	2	1	0
0	Command Code = 7Fh							
1	VU = 0		Reserved = 0				FLAG	LINK
2 - 5	Reserved = 0							
6	Reserved = 0			Group Number = 0				
7	Additional CDB Length = 18h							
8 - 9	Service Action = 000Ch							
10	WRPROTECT			DPO	Reserved = 0		ByteChk	Reserved=0
11	Reserved = 0							
12 - 19	(MSB) Logical Block Address (LSB)							
20 - 23	(MSB) Expected Initial Logical Block Reference Tag (LSB)							
24 - 25	(MSB) Expected Logical Block Application (LSB)							
26 - 27	(MSB) Logical Block Application Tag Mask (LSB)							
28 - 31	(MSB) Transfer Length (LSB)							

The WRITE AND VERIFY command requests that the drive write the data transferred from the initiator to disk and then verify that the data is correctly written.

If the RTO\_EN bit is set to zero in the READ CAPACITY (16) parameter data, Check Condition status will be returned with sense key of Illegal Request and additional sense code of Invalid Command Operation Code. If RTO\_EN is one, this command will be processed normally.

See WRITE AND VERIFY (10) - (2E) for descriptions of the WRPROTECT, DPO, ByteChk, Logical Block Address, and Transfer Length fields.

When checking of the Logical Block Reference Tag field is enabled, the Expected Initial Logical Block Reference Tag field contains the value of the Logical Block Reference Tag field expected in the protection information of the first logical block accessed by the command, instead of a value based on the LBA.

If the ATO bit is set to one in Mode Page 0A and checking of the Logical Block Application Tag field is enabled, the Logical Block Application Tag Mask field contains a value that is a bit mask for enabling the checking of the Logical Block Application Tag field in the protection information for each logical block accessed by the command. A Logical Block Application Tag Mask bit set to one enables the checking of the corresponding bit of the Expected Logical Block Application Tag field with the corresponding bit of the Logical Block Application Tag field in the protection information.

If the ATO bit is set to one in Mode Page 0A and the checking of the Logical Block Application Tag field is disabled, or if the ATO bit is set to zero, the Logical Block Application Tag Mask field and the Expected Logical Block Application Tag field are ignored.

## 19.59 WRITE BUFFER (3B)

Table 246: WRITE BUFFER (3B)

Byte	Bit							
	7	6	5	4	3	2	1	0
0	Command Code = 3Bh							
1	Reserved = 0			Mode				
2	Buffer ID							
3-5	(MSB) Buffer Offset							(LSB)
6-8	(MSB) Parameter List Length							(LSB)
9	VU = 0		Reserved = 0			FLAG	LINK	

The WRITE BUFFER command is used in conjunction with the READ BUFFER command as a diagnostic function for testing the memory of the drive and the SCSI bus integrity. This command does not alter the medium of the drive. Additional modes are provided for downloading microcode and saving microcode.

This command will cause the entire cache to be emptied.

The function of this command and the meaning of fields within the command descriptor block depend on the contents of the mode field.

MODE	Description
00000	Write combined header and data
00010	Data
00100	Download Microcode
00101	Download Microcode and Save - single binary file
00111	Download Microcode and Save - multiple binary files
01010	Write Data to Echo Buffer
11010	Enable expander Communications Protocol
All Others	Not Supported

If any values other than shown above are specified, **Check Condition** status is returned with a sense key of *Illegal Request* and additional sense code of *Invalid Field in CDB*.

## 19.59.1 Combined Header And Data (Mode 00000b)

In this mode, the data to be transferred is preceded by a four-byte header.

**Buffer ID** must be zero. If another value is specified, no download function is performed and the command is terminated with **Check Condition** status. And the drive shall set the sense key to *Illegal Request* and additional sense code to *Illegal Field in CDB*.

**Buffer Offset** must be zero. If another value is specified, no download function is performed and the command is terminated with **Check Condition** status. And the drive shall set the sense key to *Illegal Request* and additional sense code to *Illegal Field in CDB*.

**Parameter List Length** specifies the number of bytes that shall be transferred during the DATA OUT phase. This number includes four bytes of header, so the data length to be stored in the drive buffer is transfer length minus four. If the length exceeds the buffer size, the command is terminated with **Check Condition** status. And the drive shall set sense key to *Illegal Request* and additional sense code to *Illegal Field in CDB*. A Parameter List Length of less than four (size of header) indicates no data is transferred.

The 4-byte header consists of all reserved bytes.

**Table 247: Write Buffer Header**

Byte	Bit							
	7	6	5	4	3	2	1	0
0-3	Reserved = 0							

## 19.59.2 Write Data (Mode 00010b)

In this mode, the DATA OUT phase contains buffer data.

**Buffer ID** must be zero. If another value is specified, no download function is performed and the command is terminated with Check Condition status. And the drive shall set the sense key to *Illegal Request* and additional sense code to *Illegal Field In CDB*.

**Buffer Offset** specifies the offset of the memory space specified by the Buffer ID. The initiator should conform to the offset boundary requirements returned in the READ BUFFER descriptor. If the value exceeds the buffer specified, the command is terminated with **Check Condition** status. And the drive shall set the sense key to *Illegal Request* and additional sense code to *Illegal Field In CDB*.

**Parameter List Length** specifies the Parameter List Length. It must be

- less than the capacity of the buffer size after adding the Buffer Offset value and
- on a sector boundary

A Parameter List Length of zero indicates no data is to be transferred and command status is returned.

If an invalid value is specified, the command is terminated with **Check Condition** status. And the drive shall set the sense key to *Illegal Request* and additional sense code to *Illegal Field In CDB*.

### 19.59.3 Download Microcode (Mode 00100b)

**NOTE: It is not expected that a customer will ever issue this format of the command.**

In this mode, the microcode is transferred to the control memory space of the drive. When downloaded, the drive will operate with the newly downloaded code immediately until the next power cycle.

**Buffer ID** field is used to indicate which portion of the microcode image is being downloaded. The following Buffer IDs are supported by the Target:

- 00h: Main Microprocessor Code
- nnh : ID of Vendor Unique Reserved Area

Any unsupported value for the Buffer ID will cause the command to terminate with **Check Condition** status. And the drive shall set the sense key to *Illegal Request* and additional sense code to *Illegal Field In CDB*.

**Buffer Offset** must be zero. If an invalid value is specified, the command is terminated with **Check Condition** status. The drive shall set the sense key to *Illegal Request* and additional sense code to *Illegal Field in CDB*.

**Parameter List Length** must be the size of the data set to be downloaded. It may also be set to 0000h in which case no code is updated and command status is returned. If an invalid value is specified, the command is terminated with **Check Condition** status. And the drive shall set the sense key to *Illegal Request* and additional sense code to *Illegal Field In CDB*.

This process generates a unit attention condition for MICROCODE HAS BEEN CHANGED for all Initiators except the one which sent the WRITE BUFFER command. Upon the completion of the WRITE BUFFER command the new microcode is immediately ready for operation.

**Note:** The Download Microcode mode described in this specification is to indicate that the drive will accept a command with this mode, though it is not expected that a user will ever issue such a command. To use the write buffer command with this mode, a special microcode version is required from development. If such a microcode is released from development, then it will include appropriate instructions on the function of new microcode and its effect on the drive operations after download.

## 19.59.4 Download Microcode and Save (Mode 00101b) -Single Binary File

In this mode the data is transferred to the drive to save into the System reserved area on the disk. This is for functional upgrade and configuration change reflecting the user's requirements and the manufacturer's reason or both, and it is stored in the media as a permanent copy. The newly downloaded code becomes effective after the drive issues and completes a self-initiated Power On Reset.

**Note:** It requires up to 30 seconds to update the microcode including the Flash ROM update.

**Note:** New code to be downloaded to the drive will be provided by development either by request of a customer for an additional function or as a result of a functional change by development. However please note that not all possible fixes or new functions can be applied to a drive in this manner and that there is a very high dependency on the level of ROM code contained within the drive. If an invalid code or a code not compatible with the ROM code is downloaded, the drive will usually reject this code and will continue normal operation. However there is a small possibility that an invalid code will be accepted. If this occurs, the unit usually becomes inoperable and will have to be returned to the manufacturer for recovery.

**Buffer ID** field is used to indicate which portion of the microcode image is being downloaded. To download microcode, the buffer ID should be set to 00h. Other values are reserved for Hitachi development purposes only.

### 19.59.5 Download Microcode and Save (Mode 00111b) - Multiple Binary Files

In this mode the target receives a segment of the binary microcode file. The Parameter List Length (segment length) of each segment shall be a multiple of 4K bytes. The total length of all segments received shall be equal to the total length of the binary microcode file. All segments must be sent in the proper sequential order.

If an invalid Parameter List Length is specified, **Check Condition** status is returned with sense key of Illegal Request and additional sense code of *Invalid Field in CDB*.

The first segment sent in this mode indicates, by default, the first segment of the binary microcode file. If a **Check Condition** status is returned in this mode, a **Buffer ID** == 00h in the subsequent Write Buffer command in this mode indicates the first segment of the binary microcode file. Otherwise the **Buffer ID** field is ignored.

The **Buffer Offset** field is ignored.

After all segments of the binary microcode file have been received, the drive behavior is the same as Download Microcode and Save (Mode 00101b) - Single Binary File.

## **19.59.6 Write Data to Echo Buffer (Mode 01010b)**

In this mode the Target transfers data into the echo buffer. The echo buffer is assigned in the same manner by the Target as it would for a WRITE operation. Data will be sent aligned on 4-byte boundaries.

Upon successful completion of a WRITE BUFFER command the data will be preserved in the echo buffer unless there is an intervening command to any logical unit, in which case it may be changed.

### **19.59.7 Enable Expander Communications Protocol (Mode 11010b)**

In this mode the drive behavior is the same as Write Data to Echo Buffer (Mode 0101b).

## 19.60 WRITE LONG (3F)

Table 248: WRITE LONG (3F)

Byte	Bit							
	7	6	5	4	3	2	1	0
0	Command Code = 3Fh							
1	Reserved = 0			Reserved = 0				Obso- lete
2-5	(MSB) Logical Block Address							(LSB)
6	Reserved = 0							
7-8	(MSB) Byte Transfer Length							(LSB)
9	VU = 0	Reserved = 0				FLAG	LINK	

The WRITE LONG command requests the drive to write **one block** of data transferred from the Initiator.

The transfer data must include

- User Data
- 56 bytes of ECC data

Parameters are

- **Logical Block Address** field specifies the logical block at which the write operation shall occur.
- **Byte Transfer Length.** This field must specify the exact number of bytes of data available for transfer. If a non-zero byte transfer length does not match the available data length, the Target terminates the command with **Check Condition** status, then the sense key is set to *Illegal Request*, and an additional sense code is set to *Invalid Field in CDB*. The valid and ILI bits are set to one and the information field is set to the difference of the requested length minus the actual length in bytes. Negative values are indicated by two's complement notation.

## 19.61 WRITE SAME (41)

Table 249: WRITE SAME (41)

Byte	Bit							
	7	6	5	4	3	2	1	0
0	Command Code = 41h							
1	WRPROTECT			Reserved = 0		PBDA TA=0	LBDA TA=0	Obso- lete
2-5	(MSB) Logical Block Address (LSB)							
6	Reserved = 0							
7-8	(MSB) Number of Blocks (LSB)							
9	VU = 0		Reserved = 0			FLAG	LINK	

The WRITE SAME command instructs the Target to write a single block of data transferred to the Target from the Initiator to a number of sequential logical blocks. This command is useful for writing large data areas without sending all of the data over the SCSI bus.

- See the WRITE(10) command description for the definition of the WRPROTECT field.
- **Logical Block Address** specifies the address at which the write begins. The Number of Blocks specifies the number of contiguous blocks to be written. If the number is zero, all of the remaining blocks on the specified Logical Unit are written.
- **Number of Blocks** specifies the number of contiguous blocks to be written. If the number is zero, all of the remaining blocks on the specified logical unit are written.
- **RelAdr** (Relative Block Address) is not supported and must be set to be zero.

The data for this command is not retained in the cache.

## 19.62 WRITE SAME (16) - (93)

Table 250: Write Same (16) - (93)

Byte	Bit							
	7	6	5	4	3	2	1	0
0	Command Code = 93h							
1	WRPROTECT		Reserved = 0		PBDATA =0	LBDATA =0	Obsolete	
2-9	(MSB) Logical Block Address (LSB)							
10-13	(MSB) Number of Blocks (LSB)							
14	Reserved = 0							
7-8	(MSB) Number of Blocks (LSB)							
9	VU = 0		Reserved = 0			FLAG	LINK	

The Write Same command instructs the Target to write a single block of data transferred to the Target from the Initiator to a number of sequential logical blocks. This command is useful for writing large data areas without sending all of the data over the SCSI bus. See the WRITE(10) command description for the definition of the WRPROTECT field.

## 19.63 WRITE SAME (32) - (7F/0D)

Table 251: Write Same (32) - (7F/0D)

Byte	Bit							
	7	6	5	4	3	2	1	0
0	Command Code = 7Fh							
1	VU = 0		Reserved = 0				FLAG	LINK
2-5	Reserved = 0							
6	Reserved = 0			Group Number = 0				
7	Additional CDB Length = 18h							
8 - 9	Service Action = 000Dh							
10	WRPROTECT			Reserved = 0		PBDATA =0	LBDATA =0	Reserved =0
11	Reserved = 0							
12 - 19	(MSB) Logical Block Address (LSB)							
20 - 23	(MSB) Expected Initial Logical Block Reference Tag (LSB)							
24 - 25	(MSB) Expected Logical Block Application Tag (LSB)							
26 - 27	(MSB) Logical Block Application Tag Mask (LSB)							
28 - 31	(MSB) Number of Blocks (LSB)							

The WRITE SAME command requests that the drive write a single block of data transferred from the initiator to disk for a number of sequential logical blocks. This command is useful for writing large data areas with the same data, without sending all of the data over the interface. Each logical block transferred includes user data and may include protection information, based on the WRPROTECT field and the drive format. Each logical block written includes user data and, if the drive is formatted with protection information enabled, protection information.

If the RTO\_EN bit is set to zero in the READ CAPACITY (16) parameter data, Check Condition status will be returned with sense key of Illegal Request and additional sense code of Invalid Command Operation Code. If RTO\_EN is one, this command will be processed normally.

See WRITE SAME (41) for descriptions of the WRPROTECT, Logical Block Address, and Number of Blocks fields.

When checking of the Logical Block Reference Tag field is enabled, the Expected Initial Logical Block Reference Tag field contains the value of the Logical Block Reference Tag field expected in the protection information of the first logical block accessed by the command, instead of a value based on the LBA.

If the ATO bit is set to one in Mode Page 0A and checking of the Logical Block Application Tag field is enabled, the Logical Block Application Tag Mask field contains a value that is a bit mask for enabling the checking of the Logical Block Application Tag field in the protection information for each logical block accessed by the command. A Logical Block Application Tag Mask bit set to one enables the checking of the corresponding bit of the Expected Logical Block Application Tag field with the corresponding bit of the Logical Block Application Tag field in the protection information.

If the ATO bit is set to one in Mode Page 0A and the checking of the Logical Block Application Tag field is disabled, or if the ATO bit is set to zero, the Logical Block Application Tag Mask field and the Expected Logical Block Application Tag field are ignored.

## 20.0 SCSI Status Byte

Upon the completion of a command a status byte is sent to the initiator. Additional sense information may also be available depending on the contents of the status byte. The following section describes the possible values for the status byte and sense data. All Reserved fields are set to zero.

**Table 252: SCSI Status Byte. Format of the SCSI STATUS byte.**

Bit							
7	6	5	4	3	2	1	0
Reserved = 0		Status Code					RSVD

### STATUS BYTE Description

<b>00h</b>	<b>GOOD</b> The command has been successfully completed.
<b>02h</b>	<b>CHECK CONDITION</b> An error, exception, or abnormal condition has been detected. The sense data is set by the drive. The REQUEST SENSE command should be issued to determine the nature of the condition.
<b>04h</b>	<b>CONDITION MET</b> This status is returned when an unlinked PRE-FETCH command has been successfully completed.
<b>08h</b>	<b>BUSY</b> This condition is returned when disconnect privilege is not granted while the drive is BUSY processing the other command for the other initiator. The normal initiator recovery action is to issue the command at a later time or to reissue the command and grant the disconnect privilege.
<b>10h</b>	<b>INTERMEDIATE</b> Not supported.
<b>14h</b>	<b>INTERMEDIATE CONDITION MET</b> Not supported.
<b>18h</b>	<b>RESERVATION CONFLICT</b> This status is returned whenever an SCSI device attempts to access the drive, but it has been reserved by another initiator.
<b>28h</b>	<b>QUEUE FULL</b> This status indicates that the target's command queue is full. If a tagged command queuing feature is enabled and there is no room on the command queue, this status is returned when the initiator sends a command. For this status, sense data are not valid.

## 21.0 Additional information

This chapter provides additional information or descriptions of various functions, features, or operating models supported by the Target that are not fully described in previous chapters.

### 21.1 Obtaining an AL\_PA

The SCA-2 FC-AL connector used by the drive provides 7 bits which encode a preferred Hard AL\_PA for use on both loops. If this value is set to 7Fh, a Soft AL\_PA will be used.

**Note:** Loop Initialization cannot be bypassed if Soft AL\_PA is selected.

A Soft AL\_PA will also be used if, for any reason, the Hard AL\_PA cannot be obtained. If this happens, The drive will

- log out all initiators
- accept new port logins
- accept each process login with a reason code of: 05h

No special action is taken if the connector supplied AL\_PA is changed while the drive is participating on the loop(s).

### 21.2 Loop Initialization Procedure

L\_Ports use the Loop Initialization Procedure in order to acquire an AL\_PA and participate on the loop.

The drive optionally initiates the Loop Initialization Procedure shortly after power-on, depending on the configured mode settings. In addition, it may (depending on the mode settings) initiate the Loop Initialization Procedure for the following reasons:

3. When it has been unable to obtain the loop for E\_D\_TOV.
4. When a loop failure has been detected (loss of sync for R\_T\_TOV)

The Loop Initialization Procedure is disruptive to any communication that is actually in progress on the loop. IOPs that are queued or active but without any frames 'in flight' are not affected.

Initiators are not logged out by the Loop Initialization Procedure, but it is their responsibility to login if their AL\_PA changes. The drive detects (via the Port\_Name) this situation and implicitly ends the prior login. The initiator may perform a 'Port Discovery' sequence to check that the targets have not physically changed.

The L\_Port that initiates the Loop Initialization Procedure must transmit LIPs for 2 x AL\_TIME to ensure that all L\_Ports participate. By default, AL\_TIME is set to 15ms.

All L\_Ports must provide sufficient buffering to receive and transmit the LIxx frames that are circulated during the Loop Initialization Procedure. The largest of these (LILP and LIRP) have a 132 byte payload and are supported by the drive.

**Table 253: LIXx Frame Payloads**

LIXx Frame	Payload	
LISM	1101 0000h	8 - byte Port_Name
LIFA	1102 0000h	16 - byte AL_PA bit map
LIPA	1103 0000h	16 - byte AL_PA bit map
LIHA	1104 0000h	16 - byte AL_PA bit map
LISA	1105 0000h	16 - byte AL_PA bit map
LIRP	1106 0000h	128 - byte AL_PA position map
LILP	1107 0000h	128 - byte AL_PA position map

The Loop Initialization Procedure is as follows...

1. Select Initial AL\_PA  
The initial AL\_PA is EFh.

2. Select a Loop Master

LISM frames are continuously transmitted. The D\_ID and S\_ID fields are set to 0000EFh.

If a LISM frame is received which is the same as the one transmitted, the Port becomes the Loop Master and continues the procedure at step 3.

For all other received LISM frames...

- If the D\_ID is 000000h, the frame is retransmitted.
- If the Port\_Name in the payload is greater than the Port\_Name, the frame is discarded.
- If the Port\_Name in the payload is less than the Port\_Name, the frame is retransmitted.

If an ARB(F0) is received, the Port continues the procedure at step 4.

3. Loop Master

- a. ARB(F0) is continuously transmitted until ARB(F0) is received.
- b. The Port prepares an LIFA frame with an initial AL\_PA bit map of all zeros. After transmitting the LIFA frame, the Port waits to receive a LIPA frame.
- c. The AL\_PA bit map from the LIFA frame is used in a LIPA frame. If the bit corresponding to the Port's previously assigned AL\_PA is not set it is set now. If it is already set, the Port attempts to obtain its Hard AL\_PA in step d. The Port transmits the LIPA and waits to receive it back.
- d. The AL\_PA bit map from the LIPA frame is used in a LIHA frame. If the bit corresponding to the Port's hard assigned AL\_PA is not set it is set now (unless a bit was set for LIPA). If it is already set, the Port attempts to obtain a Soft AL\_PA in step e. The Port transmits the LIHA and waits to receive it back.
- e. The AL\_PA bit map from the LIHA frame is used in a LISA frame. If a bit was not set for LIHA, the bit associated with the lowest priority AL\_PA still available is set. This is the Port's "soft assigned" AL\_PA. If no bits are available, the Port shall stay in non-participating mode. The Port transmits the LISA and waits to receive it back. If byte 3 of the payload in the received LISA frame is still 01h (indicating that all nodes on the loop support positional mapping) the drive continues with the next two steps. Otherwise, the next two steps are skipped.
- f. The Port creates a LIRP frame with an AL\_PA position map of all FFh, except for the first two bytes which are 01xxh (xx is the Port's AL\_PA). The Port transmits the LIRP frame and waits to receive it back.
- g. The AL\_PA position map from the received LIRP is used to create a LILP frame. The Port transmits the LILP frame and waits to receive it back.
- h. CLS is transmitted to put all other Ports into MONITORING state. When received back, the Loop Master itself goes to MONITORING state.

4. Non Loop Master

The Port retransmits received ARB(F0) and prepares to receive the following frames, followed by CLS.

- a. When a LIFA frame is received, the Port will set the bit corresponding to the Port's "Fabric Assigned" AL\_PA if the Port was logged-in to the local FL\_Port prior to the LIP. (See 21.5, "Public Loop Operation" on page 312.) After transmitting the LIFA frame, The Port waits to receive a LIPA frame.
- b. When a LIPA frame is received (and a bit was not set for LIPA), the bit corresponding to any previously assigned AL\_PA is checked. If not set, it is set now. If it is already set, the Port attempts to obtain its Hard AL\_PA in step c. The Port transmits the LIPA.
- c. When a LIHA frame is received (and a bit was not set for LIPA), the bit corresponding to any required hard assigned AL\_PA is checked. If not set, it is set now. If it is already set, the Port attempts to obtain a Soft AL\_PA in step d. The Port transmits the LIHA.
- d. When a LISA frame is received (and a bit was not set for LIHA), the bit associated with the lowest priority AL\_PA still available is set. This is the Port's soft assigned AL\_PA. If no bits are available, the Port shall stay in non-participating mode. The Port transmits the LISA.
- e. If a LIRP frame is received, and the Port was able to claim an AL\_PA in one of the LIxA frames, the left most byte is incremented by one and used as an offset at which to store the Port's AL\_PA. The Port transmits the LIRP.
- f. If a LILP frame is received, the Port may store the AL\_PA position map for use in error recovery. The Port transmits the LILP.
- g. When CLS is received, the Port retransmits it and goes to MONITORING state.

## 21.3 Flow Control

The drive provides a Class 3 service. Flow control is maintained using R\_RDYs.

Each initiator is required to login with every target. This establishes the Login BB\_Credit, (i.e. how many frames the initiator or target may send immediately on opening or being opened.)

Prior to login, BB\_Credit is zero.

The Alternate BB\_Credit Model is operated as follows...

- On opening, the Available BB\_Credit in each direction is set to the agreed Login BB\_Credit value.
- Each frame sent decrements the Available BB\_Credit and each R\_RDY received increments it.
- If the Available BB\_Credit reaches zero, the node must stop sending frames until enough R\_RDYs have been received to restore positive credit.
- It is permissible to close before credit is balanced (i.e. R\_RDY received for each frame sent) but only when enough buffers are available to satisfy the maximum Login BB\_Credit that has been extended.

Available BB\_Credit may exceed Login BB\_Credit but a point to note is that R\_RDY is not specific to any frame type. Therefore, the amount of Available BB\_Credit that the drive will extend is limited by the amount of buffer space available for FCP\_CMND or FCP\_DATA IUs. For example, during the execution of a 512K WRITE command, there may be buffer space for 256 2K FCP\_DATA IUs and 10 FCP\_CMND IUs. The amount of credit extended will be for 10 frames.

## 21.4 Login Requirements

In order to communicate effectively, a pair of L\_Ports must exchange operational parameters. The same applies to any SCSI processes that use the L\_Ports.

The exchange of parameters is called **Login** and may be either **explicit** or **implicit**.

- **Explicit Login** is the default. L\_Ports use the PLOGI Extended Link Service sequence to exchange parameters and SCSI Processes use the PRLI Extended Link Service.
- **Implicit Login** is enabled via setting of mode page 19h. When enabled, PLOGI and PRLI are not required and a default set of parameters is assumed.

The response to certain frames at various stages of login is defined in Table 254.

**Table 254: Response to Frames before PLOGI or PRLI**

Frame Received	No PLOGI	PLOGI but no PRLI
ABTS	Discard and Send LOGO	BA_ACC or BA_RJT(1)
ADISC	Discard and Send LOGO	ACC(2) or LS_RJT
LOGO	ACC	ACC
PDISC	Discard and Send LOGO	ACC(2) or LS_RJT
PLOGI	ACC	ACC
PRLI	Discard and Send LOGO	ACC
PRLO	Discard and Send LOGO	ACC or LS_RJT(3)
Unlisted Extended Link Service	Discard and Send LOGO	ACC or LS_RJT(4)
Note: 1 - The drive returns BA_RJT to ABTS BLS when ABTS BLS has RX_ID other than 0FFFFh 2 - N_Port ID, Port_Name and Node Name must match a logged in port for ACC to be returned. 3 - If PRLI has not been successfully completed, Reason Code = 'Image Pair does not exist' 4 - Unsupported Extended Link Services are rejected.		

Login parameters remain in effect until reset or updated by...

- Power cycle
- LIP Reset
- Explicit Logout (LOGO)
- Explicit Login (PLOGI/PRLI)
- Implicit Logout (failure to re-Discover within RR\_TOV following LIP)

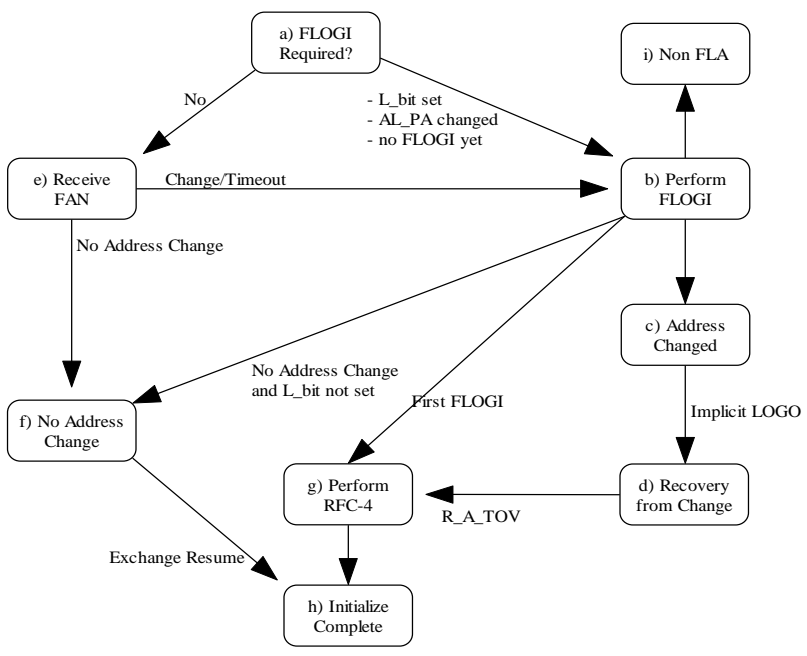

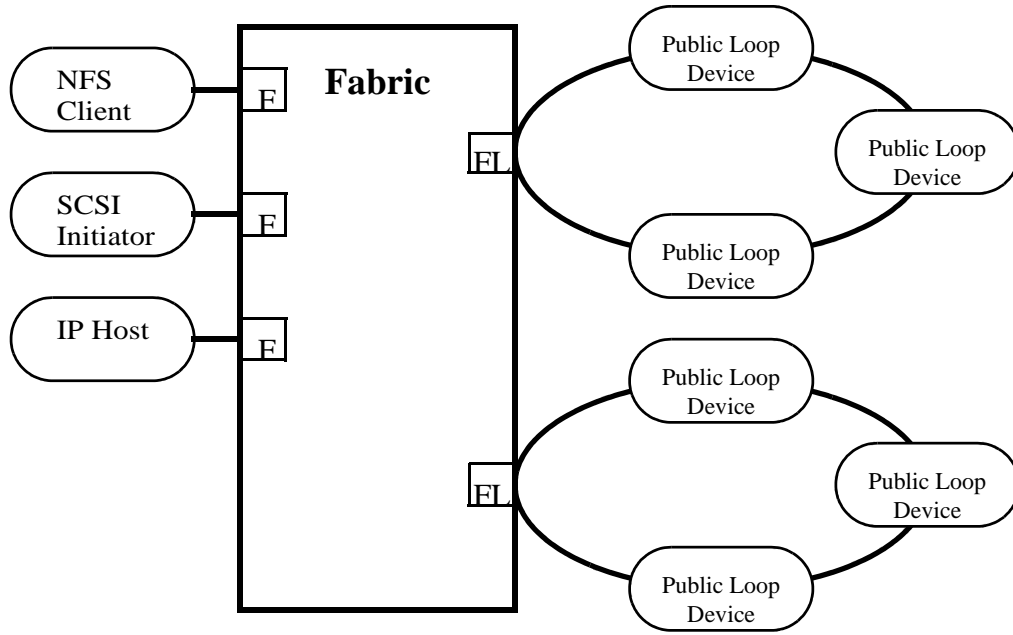

## 21.5 Public Loop Operation

The drive is designed to perform as a Public NL\_Port described in the FLA 2.70 profile.

The drive will:

- tolerate unfairness of a FL\_Port
- support 24bit addressing
- accept FAN extended link service
- perform FLOGI to Fabric F\_Port (AL\_PA = 00h, well known address 0FFFFFFEh)
- perform registration to a simple name server (AL\_PA = 00h, well known address 0FFFFFFCh) using RFC-4 service.
- claim a fabric-assigned AL\_PA during LIP in the LIFA sequence
- receive frames from a FL\_Port for more than one S\_ID in a single loop tenancy
- open L\_Port at AL\_PA = 00h and send frames to remote port
- use values of E\_D\_TOV, R\_A\_TOV as specified by the fabric in FLOGI ACC

## 21.5.1 NL\_Port Initialization

During LIP, if the port had an AL\_PA prior to the LIP, and the port had completed FLOGI, then the port attempts to acquire its Fabric-assigned AL\_PA during LIFA sequence.

#### **a) FLOGI Required**

Upon completion of LIP, the port will implicitly log out with the Fabric and perform FLOGI if one or more of the following is true:

- the L\_bit was set to one in at least the LISA sequence during the LIP.
- the port did not acquire the AL\_PA it had prior to the LIP.
- the port did not have an AL\_PA prior to the LIP.
- the port had not completed FLOGI prior to the LIP

#### **b) Perform FLOGI**

The port attempts to send FLOGI to the FL\_Port by opening AL\_PA = 00h using Full-Duplex. Meanwhile the port ignores any FAN ELS and responds to ADISC or PLOGI request sequences with an LS\_RJT reply sequence, with a Reason code of “Unable to perform Command Request at this time”. If the FLOGI request fails for any reason, the port proceeds to step i). If no address change occurred and the L\_bit is not set then the port proceeds to step f). If this is the first FLOGI or if the address has not changed and the L\_bit is set, then the port proceeds to step g).

#### **c) Address has changed**

The port has determined that its own addressing information and/or that of the FL\_Port has changed, or that it did not have completed addressing information (via FLOGI) prior to the initialization. The port discards all pending Exchanges, and performs implicit LOGO with all other ports. The port proceeds to step d).

#### **d) Recovery from address change**

The port waits R\_A\_TOV. During this time the port discards all frame received except for the PLOGI and ADISC request sequences and LOGO ACC reply sequences. The port responds to all PLOGI request with an LS\_RJT reply sequence, with a Reason code of “Unable to perform Command Request at this time”. The port responds to each ADISC request sequence with a LOGO request sequence. The port proceeds to step g).

#### **e) Receive FAN**

If FLOGI is not required, the port waits E\_D\_TOV to receive FAN ELS. The port discards all frames received except ADISC and PLOGI requests until FAN is received. The port responds to ADISC and PLOGI request sequences with an LS\_RJT reply sequence, with a Reason code of “Unable to perform Command Request at this time”.

After receiving the FAN ELS, if the port determines the FL\_Port has the same address, F\_Port\_Name and Fabric\_Name that the FL\_Port had before initialization, the port proceeds to f). Otherwise, the port implicitly logs out with the Fabric and proceeds to b).

If the port does not receive a FAN ELS within E\_D\_TOV the port proceeds to b).

#### **f) Address has not changed**

The port resumes all suspended Exchanges with Remote Ports and with Local Ports that are known to be Public NL\_Ports. If the port has any suspended Exchanges with Private Loop devices on the Local Loop, the port requires the private loop authentication described in PLDA profile. The port proceeds to step h).

#### **g) Perform RFC-4**

The port performs PLOGI with the Directory Server (AL\_PA = 00h, well known address 0FFFFFFCh) and attempts an RFC-4 request with the Name Service. Regardless of this attempt of RFC-4, the port proceeds to step h).

#### **h) Initialize complete**

This completes initialization for the port.

#### **i) Non FLA**

The port is not connected to a loop that contains an FL\_Port. The port completes initialization based on the rules described in PLDA profile.

## 21.6 SCSI Protocol

There are various operating conditions that prevent the Target from executing a SCSI command. This section describes each of these operating conditions and their relative priority.

### 21.6.1 Priority of SCSI Status Byte Reporting

After establishing the I\_T\_L nexus or I\_T\_L\_Q nexus the Target must first determine whether command execution is allowed. Execution is deferred until a later time if the command must be added to the command queue. Execution may also be prevented by an internal Target condition that requires the reporting of a Check Condition, Queue Full, Busy, or Reservation Conflict Status. There are several different internal conditions to be active at the same time. The order in which the Target checks for each of these conditions determines their priority (highest priority first) as follows:

1. Check Condition status for invalid Logical Unit Number. (See Section 21.6.2, “Invalid LUN Processing” on page 315)
2. Check Condition status for Incorrect Initiator Connection (See Section 21.6.3, “Overlapped Commands” on page 315)
3. Check Condition status for Unit Attention Condition (See Section 21.6.5, “Unit Attention Condition” on page 317)
4. Busy Status or Queue Full Status (See 21.6.4, “Command Processing During Execution of Active I/O Process” on page 316)
5. Check Condition status for Deferred Error Condition (See Section 21.6.8, “Deferred Error Condition” on page 319)
6. Check Condition status during Startup and Format operations (See Section “21.6.6, “Command Processing During Startup and Format Operations” on page 319)
7. Reservation Conflict status (See Section 21.6.10, “Command Processing while Reserved” on page 327)
8. Check Condition status for invalid command opcode
9. Check Condition status for invalid command descriptor block

The highest priority internal condition that prevents command execution is reported by the Target provided there is no bus error.

For all Check Conditions Sense data is built by the target provided a valid LUN address is known. Sense data is cleared by the Target upon receipt of any subsequent command to the LUN from the initiator receiving the Check Condition.

### 21.6.2 Invalid LUN Processing

Any value other than zero in the FCP\_LUN field of the FCP\_CMD IU is invalid.

The target's response to an invalid LUN varies with the command, as follows:

**Inquiry:** Execute the command, return the INQUIRY data that indicates unknown device type (byte 0 = 7Fh), and return GOOD status. All other bytes are valid (see 19.5, “INQUIRY (12)” on page 125).

**Request Sense:** Execute the command, return the sense data with the Sense Key set to Illegal Request and the Additional Sense Code and Additional Sense Code Qualifier set to LOGICAL UNIT NOT SUPPORTED, and return GOOD status (see also 19.34, “REQUEST SENSE (03)” on page 257).

**All Others:** Do not execute the command and return CHECK CONDITION status, along with the auto-sense data with the Sense Key set to Illegal Request and the Additional Sense Code and Additional Sense Code Qualifier set to LOGICAL UNIT NOT SUPPORTED.

In all cases, the target's response to the command for an invalid LUN does not affect the current execution of a command on the valid LUN for this initiator or any other initiator.

### 21.6.3 Overlapped Commands

Fibre Channel Protocol for SCSI Revision 012 (X3.269-1996) says the following: "5.5.9 The value of the OX\_ID is the tag defined by X3.270-1996. Since the value of the OX\_ID is required by FC-PH to be unique, there is no requirement for an FCP logical unit to check for overlapping commands." Thus the drive does not perform any overlapped command checking.

## 21.6.4 Command Processing During Execution of Active I/O Process

When the target is not executing any I/O processes, a new I/O process is permitted to execute (unless execution is prevented by another internal target condition listed in 21.6.1, “Priority of SCSI Status Byte Reporting” on page 315).

If an active I/O process exists when the target receives a new command, then the target determines if:

- the command is permitted to execute
- the command is added to the queue
- Queue Full status is to be returned
- Busy status is to be returned

If an active I/O process exists when the target receives a new command, then the target determines how the new command should be handled based on the following rules:

- Check Condition status is returned with sense key set to Logical Unit Not Ready if:
  - the startup operation or a format operation is active. See 21.6.6, “Command Processing During Startup and Format Operations” on page 319 for the exact conditions which cause this response.

**Note:** If a Unit Attention is pending when this condition exists, the sense key is set to Unit Attention rather than Logical Unit Not Ready since Unit Attention has a higher reporting priority (see 21.6.1, “Priority of SCSI Status Byte Reporting” on page 315).

- The command is permitted to execute if:
  - the command is a priority command (see 21.7, “Priority Commands” on page 327).
- the conditions to execute concurrently are met (see 21.10, “Concurrent I/O Process” on page 328).
- The command is added to the queue if:
  - any I/O process already exists at the target, and
  - this is not an incorrect initiator connection.
- Queue Full status is returned if:
  - the command would otherwise be added to the queue (according to the rules described above), but all slots in the queue are full, or
  - the command would otherwise be added to the queue (according to the rules described above), but all of the available queue slots not reserved for use by another initiator are full, or
  - a Format Unit command was previously queued but has not yet begun execution, or
  - the target is in a Degraded Mode (see 21.6.9, “Degraded Mode” on page 320) and a Start Unit command was previously queued but has not yet begun execution.
- Busy status is never returned.

## 21.6.5 Unit Attention Condition

The target generates a unit attention condition when one of the following occurs:

- The target has been reset

This includes a power-on reset or a reset caused by a Target Reset Task Management function or Reset LIP. In all of these cases, a unit attention condition is generated for each initiator. In addition, a process login (PRLI) will cause a Unit Attention Condition Power-On Reset for that initiator with an Additional Sense Code and Additional Sense Code Qualifier reported as Power-On Reset, Power-On Reset Occurred.

- MODE SELECT command has been executed

In this case, a unit attention condition is generated for all initiators except the one that issued the MODE SELECT command. The Additional Sense Code and Additional Sense Code Qualifier reported is MODE PARAMETERS CHANGED. The unit attention condition is generated if any of the current page parameters are set by the MODE SELECT command. The target does not check to see that the old parameters are different from the new parameters. For example: If the initiator issues a MODE SENSE command with a page code to report the current values followed by a MODE SELECT command with the same parameter list, a unit attention condition is generated despite the fact that the current parameters were not changed from their previous value. However, if the target detects an illegal parameter or error condition prior to modifying the current parameters, a unit attention condition is not generated since the parameters were not set. The unit attention condition is also not generated if the MODE SELECT command parameter list does not include any pages and only the header or header/block descriptor is present.

- FORMAT UNIT command has been executed

In this case, a unit attention condition is generated for all initiators except the one that issued the FORMAT UNIT command. The Additional Sense Code and Additional Sense Code Qualifier reported is NOT READY TO READY TRANSITION, (MEDIUM MAY HAVE CHANGED). This indicates that the block descriptor parameters from the last MODE SELECT command have been used and are now considered current values.

- WRITE BUFFER command to download microcode has been executed

In this case, a unit attention condition is generated for all initiators except the one that issued the WRITE BUFFER command. The Additional Sense Code and Additional Sense Code Qualifier reported is MICROCODE HAS BEEN CHANGED.

- Commands Cleared by another initiator

This unit attention condition is generated after an initiator sends a Clear Task Set Task Management function. The unit attention condition is generated for all other initiators with I/O processes that were either active or queued for the logical unit. The Additional Sense Code and Additional Sense Code Qualifier reported is COMMANDS CLEARED BY ANOTHER INITIATOR.

- LOG SELECT command with PCR bit has cleared parameters.

In this case, a unit attention condition is generated for all initiators except the one that issued the LOG SELECT command. The additional sense code and additional sense code qualifier reported is Log Select Parameters Changed.

- The registration or reservation made by a Persistent Reserve Out command was cleared by another initiator.

In this case, a unit attention condition is generated for the initiator that held the cleared registration or reservation.

- A Predictive Failure Analysis threshold has been reached and the Method of Reporting field of mode page 1Ch is 2h.

The unit attention condition persists for each initiator until that initiator clears the condition from the logical unit as described below. Several commands are handled as special cases during a unit attention condition. These cases are also discussed below.

If the target receives a command from an initiator before reporting a CHECK CONDITION status for a pending unit attention condition for that initiator, the target's response varies with the command as follows:

- Inquiry**           Execute the command, return GOOD status, and preserve the unit attention condition.
- Report Luns**       Same as above
- Request Sense**   Execute the command, return any pending sense data, return GOOD status, and preserve the unit attention condition. If there is not any pending sense data, the sense data associated with the highest priority unit attention condition is returned and the highest priority unit attention condition is cleared for this initiator.
- All Others**       Do not execute the command, return a CHECK CONDITION status, clear the highest priority unit attention condition for this initiator and return the associated sense data.

More than one unit attention condition may be generated for an initiator before that initiator clears the unit attention condition.

## 21.6.6 Command Processing During Startup and Format Operations

If the Target receives a command from an Initiator while the Target is executing a startup or format operation, the response of the Target varies with the command as follows:

<b>INQUIRY</b>	The drive sends inquiry data and returns appropriate status.
<b>REQUEST SENSE</b>	Executes the command, returns a Sense key of NOT READY and an Additional Sense Code of LOGICAL UNIT NOT READY and returns GOOD STATUS.  The Additional Sense Code Qualifier that is returned depends on type of I/O processes that are active:  For the START/UNIT STOP and the Auto-start operation, the qualifier returned is LOGICAL UNIT IS IN PROCESS OF BECOMING READY. For the FORMAT UNIT command, the qualifier returned is LOGICAL UNIT NOT READY, FORMAT IN PROGRESS, and the Sense key specific bytes are set to return the progress indication.
<b>REPORT LUNS</b>	The drive sends REPORT LUNS data and appropriate status.
<b>ALL OTHER</b>	The drive terminates the command with CHECK CONDITION status. The Sense data generated is described in Request Sense above.

## 21.6.7 Internal Error Condition

The Target generates an Internal Error condition for all Initiators when an internally initiated operation ends with an unrecoverable error, that is, the startup sequence for Auto Start enabled terminates after the SCSI bus has been enabled and prior to completion of the bring-up sequence.

An Internal Error condition causes Sense data to be generated and saved for all Initiators. The Error Code field of the Sense is set for a Current Error (70h) and the Sense Key is set to HARDWARE ERROR. Recovered errors are not reported.

The Internal Error condition persists for each Initiator until that Initiator clears the condition from the logical unit as described below. Several commands are handled as special cases during an Internal Error condition. These cases are also discussed.

If the Target receives a command from an Initiator while an Internal Error condition exists for that Initiator, the response of the Target varies with the command as follows:

<b>INQUIRY</b>	The drive executes the command with GOOD status and does not clear the Internal Error condition.
<b>REQUEST SENSE</b>	The drive executes the command, returns the sense data generated by the Internal Error condition, returns Good Status, and clears the Internal Error condition for that Initiator.
<b>ALL OTHER</b>	The drive terminates the command with a CHECK CONDITION status and clears the Internal Error condition.

## 21.6.8 Deferred Error Condition

Error code (71h) of sense data indicates that the Check Condition status returned is the result of an error or exception condition that occurred during execution of a previous command for which Good status has already been returned.

The drive creates an Deferred Error condition when

- Execution of a Format Unit command with the immediate bit of one ends with an error.
- Execution of a Write command with WCE (Write Cache Enable) bit of one ends with an error.

## 21.6.9 Degraded Mode

There are certain errors or conditions which may impair the ability of the drive to function normally. Rather than fail hard the drive is designed to be as responsive as possible. Also, in most cases, some action on the part of the initiator may be used to restore normal operation. This mode of limited operation is called Degraded Mode.

There are 3 conditions in the Degraded Mode:

- Spindle Motor Degrade which is caused by one of the following conditions:
  - Spindle Motor is not started by the option jumper setting (Disable Auto Spin Up)
  - Spindle Motor is delayed from spinning up by the option jumper setting (Auto Start Delay)
  - Spindle Motor was started (by POR or Unit Start command) and the Target is under Self Configuration.
  - Spindle Motor Failed to start.
  - Spindle Motor was stopped by Unit Stop command after the Target successfully completed the Self Configuration.
- Self Configuration Failure Degraded which is caused by one of the following conditions:
  - RAM Code, Configuration Sector Read Failure
  - RAM Code, Configuration Sector Revision Mismatch
- Format Command Failure Degraded. This condition is caused when Format Unit command failed or was interrupted abnormally (Mode Page 0, byte 5, bit 4 FDD controls Format Degraded mode)

### 21.6.9.1 Response to SCSI Command in Degraded Mode - Disable Auto Start

The tables on the following pages show the degraded mode status with acceptable commands and additional sense codes

**Table 255: Spindle Motor Degraded Mode - Disable Auto Start**

Command (w/Option)	Response
Request Sense	Executed. The Target may return Sense Key 02h (Not Ready) ASC/ASCQ 0402h (Initialize Command Required)
Inquiry (EVPD=0)	Executed
Inquiry (EVPD=1)	Executed and Check Condition is returned with Sense Key 05h (Illegal Request) ASC/ASCQ 2400h (Invalid Field in CDB)
Test Unit Ready	Executed and Check Condition is returned with Sense Key 02h (Not Ready) ASC/ASCQ 0402h (Initialize Command Required)
Start Stop Unit (Start)	<p>Executed</p> <ul style="list-style-type: none"> <li>- Success: Good Status is returned. Motor Degraded Mode is cleared</li> <li>- Spindle Motor Start Failure: Check Condition with Sense Key 02h (Not Ready) ASC/ASCQ 0400h (Start Spindle Motor Fail)</li> <li>- Self Configuration Failure: Check Condition with Sense Key 02h (Not Ready) ASC/ASCQ 4080h (Diag Fail- Bring up Fail)</li> </ul> <p>Sense Key 02h (Not Ready) ASC/ASCQ 4085h (Diag Fail-RAM Code NOT load)</p>
Start Stop Unit (Stop)	Executed. Good Status is returned. Motor Degraded Mode is NOT cleared
Other Commands	Not Executed. Check Condition Status is returned with Sense Key 02h (Not Ready) ASC/ASCQ 0402h (Initialize Command Required)

## 21.6.9.2 Response to SCSI Command in Degraded Mode - Auto Start Delay/ Spinning Up

**Table 256: Spindle Motor Degraded Mode - Auto Start Delay/Spinning Up**

Command (w/Option)	Response
Request Sense	Executed. The Target may return Sense Key 02h (Not Ready) ASC/ASCQ 0401h (In Process of Becoming Ready)
Inquiry (EVPD=0)	Executed
Inquiry (EVPD=1)	Executed and Check Condition is returned with Sense Key 05h (Illegal Request) ASC/ASCQ 2400h (Invalid Field in CDB)
Test Unit Ready	Executed and Check Condition is returned with Sense Key 02h (Not Ready) ASC/ASCQ 0401h (In Process of Becoming Ready)
Start Stop Unit (Start)	<p>Executed</p> <ul style="list-style-type: none"> <li>- Success: Good Status is returned. Motor Degraded Mode is cleared</li> <li>- Spindle Motor Start Failure: Check Condition with Sense Key 02h (Not Ready) ASC/ASCQ 0400h (Start Spindle Motor Fail)</li> <li>- Self Configuration Failure: Check Condition with Sense Key 02h (Not Ready) ASC/ASCQ 4080h (Diag Fail- Bring up Fail)</li> </ul> <p>Sense Key 02h (Not Ready) ASC/ASCQ 4085h (Diag Fail-RAM Code NOT load)</p>
Other Commands	Not Executed. Check Condition Status is returned with Sense Key 02h (Not Ready) ASC/ASCQ 0401h (In Process of Becoming Ready)

### 21.6.9.3 Response to SCSI Command in Degraded Mode - Spindle Start Failure

**Table 257: Spindle Motor Degraded Mode - Spindle Start Failure**

Command (w/Option)	Response
Request Sense	Executed. The Target may return Sense Key 02h (Not Ready) ASC/ASCQ 0400h (Start Spindle Motor Fail)
Inquiry (EVPD=0)	Executed
Inquiry (EVPD=1)	Executed and Check Condition is returned with Sense Key 05h (Illegal Request) ASC/ASCQ 2400h (Invalid Field in CDB)
Test Unit Ready	Executed and Check Condition is returned with Sense Key 02h (Not Ready) ASC/ASCQ 0400h (Start Spindle Motor Fail)
Start Stop Unit (Start)	<p>Executed</p> <ul style="list-style-type: none"> <li>- Success: Good Status is returned. Motor Degraded Mode is cleared</li> <li>- Spindle Motor Start Failure: Check Condition with Sense Key 02h (Not Ready) ASC/ASCQ 0400h (Start Spindle Motor Fail)</li> <li>- Self Configuration Failure: Check Condition with Sense Key 02h (Not Ready) ASC/ASCQ 4080h (Diag Fail- Bring up Fail)</li> </ul> <p>Sense Key 02h (Not Ready) ASC/ASCQ 4085h (Diag Fail-RAM Code NOT load)</p>
Start Stop Unit (Stop)	Executed. Good Status is returned. Motor Degraded Mode is NOT cleared
Other Commands	Not Executed. Check Condition Status is returned with Sense Key 02h (Not Ready) ASC/ASCQ 0400h (Start Spindle Motor Fail)

## 21.6.9.4 Response to SCSI Command in Degraded Mode - Spindle Stopped by Unit Stop Command

**Table 258: Spindle Motor Degraded Mode - Spindle Stopped by Unit Stop Command**

Command (w/Option)	Response
Request Sense	Executed. The Target may return Sense Key 02h (Not Ready) ASC/ASCQ 0402h (Initialize Command Required)
Inquiry (EVPD=0)	Executed
Inquiry (EVPD=1)	Executed
Test Unit Ready	Executed and Check Condition is returned with Sense Key 02h (Not Ready) ASC/ASCQ 0402h (Initialize Command Required)
Start Stop Unit (Start)	<p>Executed</p> <ul style="list-style-type: none"> <li>- Success: Good Status is returned. Motor Degraded Mode is cleared</li> <li>- Spindle Motor Start Failure: Check Condition with Sense Key 02h (Not Ready) ASC/ASCQ 0400h (Start Spindle Motor Fail)</li> <li>- Self Configuration Failure: Check Condition with Sense Key 02h (Not Ready) ASC/ASCQ 4080h (Diag Fail- Bring up Fail)</li> </ul> <p>Sense Key 02h (Not Ready) ASC/ASCQ 4085h (Diag Fail-RAM code NOT load)</p>
Start Stop Unit (Stop)	Executed. Good Status is returned. Motor Degraded Mode is NOT cleared
Other Commands	Not Executed. Check Condition Status is returned with Sense Key 02h (Not Ready) ASC/ASCQ 0402h (Initialize Command Required)

## 21.6.9.5 Self Configuration Failure Degraded Mode

**Table 259: Self Configuration Failure Degraded Mode**

Command (w/Option)	Response
Request Sense	Executed. The Target may return Sense Key 02h (Not Ready) ASC/ASCQ 4080h (Diag Fail- Bring up Fail) Sense Key 02h (Not Ready) ASC/ASCQ 4085h (Diag Fail-RAM code NOT load)
Inquiry (EVPD=0)	Executed
Inquiry (EVPD=1)	Executed and Check Condition is returned with Sense Key 05h (Illegal Request) ASC/ASCQ 2400h (Invalid Field in CDB)
Test Unit Ready	Executed and Check Condition is returned with Sense Key 02h (Not Ready) ASC/ASCQ 4080h (Diag Fail- Bring up Fail) Sense Key 02h (Not Ready) ASC/ASCQ 4085h (Diag Fail-RAM code NOT load)
Start Stop Unit (Start)	Executed - Success: Good Status is returned. Motor Degraded Mode is cleared - Spindle Motor Start Failure: Check Condition with Sense Key 02h (Not Ready) ASC/ASCQ 0400h (Start Spindle Motor Fail) - Self Configuration Failure: Check Condition with Sense Key 02h (Not Ready) ASC/ASCQ 4080h (Diag Fail- Bring up Fail) Sense Key 02h (Not Ready) ASC/ASCQ 4085h (Diag Fail-RAM code NOT load)
Write Buffer (Download and Save)	Executed. - Success: Good Status is returned. Motor Degraded Mode is cleared - Self Configuration Failure: Check Condition with Sense Key 02h (Not Ready) ASC/ASCQ 4080h (Diag Fail- Bring up Fail) Sense Key 02h (Not Ready) ASC/ASCQ 4085h (Diag Fail-RAM code NOT load)
Other Commands	Not Executed. Check Condition Status is returned with Sense Key 02h (Not Ready) ASC/ASCQ 4080h (Diag Fail- Bring up Fail) Sense Key 02h (Not Ready) ASC/ASCQ 4085h (Diag Fail-RAM code NOT load)

### 21.6.9.6 Format Command Failure Degraded Mode

**Table 260: Format Command Failure Degraded Mode**

Command (w/Option)	Response
Request Sense	Executed. The Target may return Sense Key 02h (Not Ready) ASC/ASCQ 3100h (Format Corrupted) Sense Key 03h (Medium Error) ASC/ASCQ 3100h (Format Corrupted)
Inquiry (EVPD=0)	Executed
Inquiry (EVPD=1)	Executed
Test Unit Ready	Executed and Check Condition is returned with Sense Key 02h (Not Ready) ASC/ASCQ 3100h (Format Corrupted)
Format Unit	Executed - Success: Good Status is returned. Format Degraded Mode is cleared - Failure: Check Condition Status is returned and Format Degraded Mode is NOT cleared.
Other Commands	Not Executed. Check Condition Status is returned with Sense Key 03h (Medium Error) ASC/ASCQ 3100h (Format Corrupted)

**Note:** Mode Page 0 byte 5 bit 4 (FDD) = 0

## 21.6.10 Command Processing while Reserved

A logical unit is reserved after successful execution of the Reserve command. Each time a Reserve command is executed successfully, the Target records the SCSI ID of the Initiator that made the reservation and the SCSI ID of the Initiator that is to receive the reservation. This information is needed to determine whether subsequent commands should be permitted or if the Reservation Conflict Status should be reported. The Initiator that made the reservation is the Initiator that issued the Reserve command. The Initiator to receive the reservation may be either the same or a different Initiator (third-party reservation).

If the logical unit is reserved when a new command is received, the Target examines the command opcode and the SCSI ID of the issuing Initiator to determine whether a Reservation Conflict Status should be returned based on the following rules:

If the issuing Initiator is the one that made the reservation and also the one to receive the reservation, then all commands are permitted.

If the issuing Initiator is neither the one that made the reservation nor the one to receive the reservation, then

- A Request Sense or Inquiry command is permitted.
- A Release command is permitted but is ignored.
- Any other command results in a Reservation Conflict Status.

If the issuing Initiator is the one that made the reservation but is not the one to receive the reservation, then

- An Inquiry, Request Sense, Reserve, or Release command is permitted.
- Any other command results in a Reservation Conflict Status.

If the issuing Initiator is not the one that made the reservation but is the one to receive the reservation, then

- A Reserve command results in a Reservation Conflict Status.
- A Release command is permitted but is ignored.
- Any other command is permitted.

If a Reservation Conflict Status is not reported and the command is permitted, then the Target checks the next highest priority internal condition to determine whether execution is allowed. See Section 21.6.1, “Priority of SCSI Status Byte Reporting” on page 315.

## 21.7 Priority Commands

Certain SCSI commands always execute without returning a Busy Status or Reservation Conflict Status in response to the command. These commands are

- Inquiry
- Request Sense
- Report LUNs
- Test Unit Ready

These commands are executed prior to attempting to complete the execution of any other pending command in the queue. These commands are never queued.

## 21.8 Command Queuing

When the initiator specifies that the drive shall disable command queuing, the initiator must send only untagged commands. When the initiator specifies that the target shall enable command queuing, the initiator may send either tagged or untagged command, but shall not use both at the same time.

The following commands are never queued.

- Priority Commands (i.e.: Request Sense and Inquiry)
- Commands for an invalid LUN.

### 21.8.1 Queue Depth

Any initiator can queue at least one command at any time irrespective of the actions of any other initiators in the system. A single initiator may queue up to 128 commands, if no other initiator has more than one command in the queue, although at times this maximum may be reduced as the drive can reserve command blocks for internal use.

### 21.8.2 Queue Full Status

The drive will respond with QUEUE FULL status to a SCSI command when all queue slots are utilized. The SCSI command is not placed in the command queue under this condition.

### 21.8.3 Effects of LIP on Command Queuing

When a loop re-initializes (via a LIP sequence) command execution for all initiators on the initializing port is suspended. After loop initialization is complete, the drive will maintain all queued commands for all initiators up to RR\_TOV. If an initiator performs Exchange Authentication (via PDISC or ADISC) within RR\_TOV, its queued commands will now be free to execute.

If an initiator fails to authenticate within RR\_TOV, the initiator will be implicitly logged out, and the commands will be removed from the command queue.

### 21.8.4 Termination of I/O Processes

Normal termination of I/O processes occurs when the target returns SCSI status. I/O processes may also be terminated by the following:

- An ABORT TASK terminates the specified I/O process from the issuing initiator
- An ABORT TASK SET terminates all I/O processes from the issuing initiator
- A CLEAR TASK SET, TARGET RESET or reset terminates all I/O processes from all initiators
- Failure by an initiator to initiate Exchange Authentication within RR\_TOV of the completion of Loop Initialization results in an implicit logout and termination of all associated I/O processes (21.8.5 Effects of LIP on Command Queuing on a page 291)

## 21.9 Command Reordering

Command reordering is supported when enabled by the Queue Algorithm Modifier in mode page 0A ( see 19.10.9, “Mode Page 0A (Control Mode Page Parameters)” on page 186.

### 21.10 Concurrent I/O Process

Concurrent command are always allowed to execute concurrently with non-priority commands. A second priority command received while a priority command is being executed is put at the head of the command queue.

- WRITE commands when another WRITE command is an active I/O process
- READ commands when another READ command is an active I/O process

When a concurrent command ends in CHECK CONDITION status, the QErr bit on the Mode Page 0Ah will determine how other active I/O processes from the same initiator for that drive will be handled.

## 21.11 Write Cache

If the WCE (Write cache enable) bit is 1, the drive returns Good Status and Task complete message and goes to Bus Free immediately after receiving the data of the last sector before actually writing the data onto the media.

If the drive detects an error after it returns a Good Status, the drive sets a Deferred Error (Error Code of sense data = 71h) and a following command will be returned with Check Condition and the Contingent allegiance condition is established. Under the Contingent allegiance condition all queued processes including commands from other initiators are suspended.

## 21.12 Automatic Rewrite/Reallocate

The target supports Auto and Recommended Reallocate for READ, WRITE, WRITE VERIFY, and VERIFY.

Automatic and Recommend Reallocate operate from within the read/write command. When an automatic reallocation occurs, the read or write command takes longer to complete.

This operation is sometimes referred to as auto-reassignment due to its similarity to the operation performed by the reassign command.

Following is a description of the target behavior for each setting of ARRE. ARRE setting affects all data errors. (No Sector Found, Data Sync Byte Errors and Data ECC Errors.)

**ARRE=1:** An error site determined to need rewriting or reallocation during a read is automatically rewritten or reallocated at the conclusion of the read and prior to the sending of the status. The site will be automatically rewritten or reallocated only if the data has been successfully read.

**ARRE=0:** An error site determined to need rewriting or reassignment during a read is recommended for rewriting or reassignment at the conclusion of the read.

The setting of the ARRE bit is checked and the target will automatically rewrite/reallocate or recommend rewrite/reassign for the following commands.

- Read
- Write

For all other commands the ARRE setting is ignored and the target will not automatically rewrite/ reallocate or recommend rewrite/reassign.

Following is a description of the target behavior for each setting of AWRE. AWRE setting effects only No Sector Found Errors on writes.

**AWRE=1:** An error site determined to need reassignment during a write is automatically reallocated at the conclusion of the write and prior to sending the status. The site will be automatically reallocated only if the write recovery succeeded at the conclusion of the write.

**AWRE=0:** An error site determined to need reassignment during a write is recommended for reassignment at the conclusion of the write.

The setting of the AWRE bit is checked and the target will automatically reallocate or recommend reassign for the following commands.

- Write(6)
- Write(10)
- Write portion of Write and Verify

For all other commands the AWRE setting is ignored and the target will not automatically reallocate or recommend reassign.

Auto/Recommend Reallocate information is communicated via the sense data returned following a command during which a site was determined to need rewriting or reassignment. The LBA returned in the sense data is the LBA that was determined to need rewriting or reassignment.

The sense data combinations with auto/recommend rewrite/reallocate are listed below.

**Table 261: Sense data combinations with auto/recommend rewrite/reallocate**

Key	Code	Qual	Description
1	17	01	Recovered Data with retries
1	17	06	Recovered Data without ECC - Auto Reallocated
1	17	07	Recovered Data without ECC - Recommend Reassign
1	17	09	Recovered Data without ECC - Data Rewritten
1	18	00	Recovered Data with ECC
1	18	02	Recovered Data with ECC - Auto Reallocated
1	18	05	Recovered Data with ECC - Recommend Reassign
1	18	07	Recovered Data with ECC - Data Rewritten

## 21.13 Segmented Caching

### 21.13.1 Overview

Segmented Caching divides the data buffer into several smaller buffers. Each buffer is used as Read/ Write/Read-Ahead buffer.

### 21.13.2 Read Ahead

The Read Ahead function consists of reading data that the Initiator has not yet requested to the drive buffer. This function is intended to improve performance for an initiator that frequently accesses sequential data with successive SCSI read commands. The Read Ahead function works when RCD (the read cache disable) bit of read cache page (page 08h) is set to zero.

The drive initiates the Read ahead function when the following conditions exist:

- RCD is 0
- Read, Verify and Write and Verify is received.
- The consecutive LBA of the requested LBA is not available in the buffer

If SCSI reset or target reset message is received, all contents of segmented buffer is flushed.

Even if an error occurs during the Read ahead, the error will not be reported to the Initiator. The data read before the error occurred will be stored as valid data by the Read Ahead function.

## 21.14 Multiple Initiator Systems

This section describes how the target behaves in a multiple initiator system. Up to 64 initiators may be supported at any one time.

### 21.14.1 Sense Data

A separate sense data area is reserved for each initiator. Each area is maintained independently. This allows a command from one initiator to complete with a CHECK CONDITION status and generate sense data without being affected by a subsequent command from a different initiator. There is no requirement for the first initiator to send a REQUEST SENSE command to retrieve the Sense Data prior to the execution of a command from a different initiator.

### 21.14.2 Mode Pages

A single set of Mode pages is maintained. This includes both current and saved parameters. If a MODE SELECT command is executed that updates the current parameters, a unit attention condition is generated for all initiators except the one that issued the command. See 21.6.5, "Unit Attention Condition" on page 317 for more information.

## 21.15 Enclosure Services

**Enclosure Services** allow the Host Computer System to access information held by the Enclosure Microcontroller using the same industry standard interface as the enclosed devices.

This disk drive supports the ESI (Enclosure Services Interface) for this purpose, as described in the Functional Specification.

The drive sets the EncServ bit to 1b in the Standard INQUIRY Data indicating that it supports enclosure services. This indicates that the Host may use the SEND DIAGNOSTIC and RECEIVE DIAGNOSTIC RESULTS commands to access information held by the Enclosure. This information is in the form of 'Diagnostic Pages'.

Diagnostic Pages 01h to 0Fh are reserved for Enclosure Services.

There are two distinct forms of Enclosure Services. The EncServ bit does not specify which form the Target and Enclosure are capable of (if any). The Host can discover this by using a RECEIVE DIAGNOSTIC RESULTS command to request Diagnostic Page 00h.

When requested to communicate with the enclosure via the SEND and RECEIVE DIAGNOSTIC commands, the drive goes

through a 'discovery phase' with the enclosure as defined in the SFF-8067 standard. The results of this discovery phase determine whether the enclosure: 1) does not support Enclosure Services, 2) supports only the 'short' Enclosure Services mode as defined by SFF-8045, or 3) supports the 'long' Enclosure Services mode as defined by SFF-8067. After the discovery phase, the drive behaves in accordance with the Enclosure Services mode capabilities of the enclosure. The drive does not attempt to remember the Enclosure Services capabilities of the enclosure, but rather, in accordance with the SFF-8067 standard, re-performs the discovery phase for each SEND and RECIEVE DIAGNOSTIC command received.

### **Short**

This mode is defined for use when an Enclosure simply supplies an 7-bit parameter as defined by the SFF-8045 standard to the drive.

When mounted in this type of Enclosure, an attempt to access any Enclosure Service Diagnostic Page using the SEND DIAGNOSTIC command will terminate the command with CHECK CONDITION status. The sense data will have a Sense Key of Illegal Request and an Additional Sense Code of UNSUPPORTED ENCLOSURE FUNCTION.

Requesting any Enclosure Service Diagnostic Page using the RECEIVE DIAGNOSTIC RESULTS command will return only Diagnostic Page 08h (Short Enclosure Status).

### **Long**

This form is defined for use when the Enclosure and target are able to communicate using the secondary interface as defined in the SFF-8067 standard.

When mounted in this type of Enclosure, any attempt to access an Enclosure Service Diagnostic Page using the SEND DIAGNOSTIC or RECEIVE DIAGNOSTIC RESULTS commands results in the Diagnostic Page being transferred to/from the enclosure. CHECK CONDITION status and sense data with an appropriate Sense Key and Additional Sense Code is generated if the transfer fails or cannot be performed.

**Note:** For a more detailed description of Enclosure Services, please refer to the following specifications:

- SFF-8067 Specification

## **21.15.1 Enclosure Initiated ESI**

This drive supports Enclosure Initiated ESI as described in the SFF-8067 standard.

## **21.16 Multiple Initiator Environment**

### **21.16.1 Initiator Sense Data**

Separate sense data is reserved for each I-T-L. Each sense data is maintained independent of commands from other initiators.

### **21.16.2 Initiator Mode Select/Mode Sense Parameters**

A single shared copy of the Mode Select/Mode Sense parameters is maintained by the drive. This includes both the current and saved parameters.

## **21.17 Reset**

Reset actions will return the drive to a known, initialized state.

This device supports the Hard reset option as defined in the SCSI standards (see 7.1.9 Dev\_Ctrl\_Code\_x on page 33) and the reset sources discussed below.

## 21.17.1 Reset Sources

There are four sources of resets detected by the target:

<b>Reset Name</b>	<b>Reset Source</b>
Power-On Reset	This is the signal generated by the hardware at initial power-on
Self-Initiated reset	This is a software-generated reset that occurs when a catastrophic error is detected by the microcode.
LIP Reset	This is a LIP(AL_PS_PD) primitive sequence where the AL_PD matches the AL_PA of the drive.
Target Reset	This is an FCP_CMD IU with the TARGET RESET TMF flag set.
Reset LUN	This is a FCP_CMD IU with the RESET LUN TMF flag set.

## 21.17.2 Reset Actions

The action taken by the drive following a reset is dependent on the source of the reset.

### 21.17.2.1 Power-On reset and Self-Initiated reset

These two reset conditions cause the following to be performed in the order shown:

- A power-up sequence
- A startup sequence is necessary to put the drive in a ready state

These reset conditions cause the following actions:

- If the reset occurs during the power-up sequence, the power-up sequence is re-started.
- If the auto-start option is enabled and a start-up sequence has not yet completed, the start-up sequence is restarted.  
Note: The power-up sequence is not re-run, since it has already completed.
- If the reset occurs while a physical sector is being written, the WRITE operation is disabled at the end of the current sector. The media is not corrupted if power is maintained to the end of the current sector.

## 21.18 Diagnostics

The drive will execute Power on Diagnostics at power on time to assure the correct operation of the drive by validating components (ROM, RAM, Sector Buffer, EEPROM, HDC, Spindle Motor, Actuator), checking stored information in the Reserved Area and EEPROM, and verifying fault detects circuits.

Self-test can be invoked by issuing a SEND DIAGNOSTIC command.

### 21.18.1 Power on Diagnostics

At power on time the following tests are executed:

1. Validation of ROM and EEPROM
2. RAM test for internal RAM
3. Test and Initialize HDC registers
4. RAM test for Sector Buffer
5. Start Spindle Motor (if Auto spin up enable)

6. Calibration of Actuator
7. Read/Write test for all Heads
8. Validation of RAM code and data table (RDM, Log, Mode Page) from the Reserved Area

If Auto spin up is disabled, steps 5 - 8 will be executed by the first START STOP UNIT command which has the Start bit set.

Faults detected before successful completion of the HDC section could prevent the drive from responding to a selection.

Faults detected after the successful completion of the HDC test section will be reported as CHECK CONDITION status to the Initiator on the first command issued after a fault is detected (except for the INQUIRY, REPORT LUNS and REQUEST SENSE commands). The INQUIRY, REPORT LUNS and REQUEST SENSE commands will always be responded with a GOOD status. Detecting a fault during power on will not terminate execution of the tests nor will it terminate the power on process.

## 21.18.2 Self-test via SEND DIAGNOSTIC Command

### 21.18.2.1 Default Self-test

The default self-test is invoked by the SlfTst bit in the SEND DIAGNOSTIC command. The response is simply a GOOD status if the test is successful or a CHECK CONDITION status if the test fails.

The following tests are performed by the default self-test (in the order defined):

1. **Spin check** is to check if the spindle motor is running at the correct speed.
2. **Write, Read and Compare test** is a disk read/write test. It writes data to a predefined location in the reserved area and then reads it back and validates the content. All heads are tested.
3. **ECC circuit test** is a test for ECC circuit to ensure that errors can be corrected by the circuit.
4. **Seek test** is a servo test. It validates seeks to 256 random locations out of the full volume.

### 21.18.2.2 Short and Extended Self-tests

There are two other types of self-tests that may be invoked using the Function Code field in the SEND DIAGNOSTIC command: a short self-test and an extended self-test. The tests performed in the short and extended self-tests are described later. The time required by a logical unit to complete its extended self-test is specified in the Extended self-test Completion Time field in the Control Mode Page. The results of self-test can be retrieved via the LOG SENSE command for Log Page 10.

### 21.18.2.3 Self-test Modes

There are two modes for short and extended self-tests: a foreground mode and a background mode. These modes are described in the following clauses.

#### Foreground mode

When the drive receives a SEND DIAGNOSTIC command specifying a self-test to be performed in the foreground mode, the drive will return status for that command after the self-test has been completed. While performing a self-test in the foreground mode, the drive will respond to all commands except INQUIRY, REPORT LUNS, and REQUEST SENSE with a CHECK CONDITION status, a sense key of NOT READY and an additional sense code of LOGICAL UNIT NOT READY - SELF-TEST IN PROGRESS.

If the drive is performing a self-test in the foreground mode and a test error occurs, the drive will update the self-test results log page and report CHECK CONDITION status with a sense key of HARDWARE ERROR and an additional sense code of LOGICAL UNIT FAILED SELF-TEST. The application client may obtain additional information about the failure by reading the self-test results log page.

An application client may terminate a self-test that is being performed in the foreground mode using an ABORT TASK, ABORT TASK SET, or CLEAR TASK SET task management function. If the drive receives an ABORT TASK, ABORT TASK SET, or CLEAR TASK SET task management function while performing a self-test in the foreground mode, it will abort the self-test and update the self-test results log page.

#### Background mode

When the drive receives a SEND DIAGNOSTIC command specifying a self-test to be performed in the background mode, the drive will return status for that command as soon as the command descriptor block has been validated. After returning status for the SEND DIAGNOSTIC command specifying a self-test to be performed in the background mode, the drive will initialize the self-test results log page as follows. The Function Code from the SEND DIAGNOSTIC command will be placed in the Function Code field in the log page. The self-test Results field shall be set to 0Fh. After the self-test results log page is initialized, the drive will begin the first self-test segment.

While the device server is performing a self-test in the background mode, it shall terminate with a CHECK CONDITION status any SEND DIAGNOSTIC command it receives that meets one of the following criteria:

- a. The SltTst bit is one
- b. The Function Code field contains a value other than 000b or 100b.

When terminating the SEND DIAGNOSTIC command, the sense key shall be set to NOT READY and the additional sense code shall be set to LOGICAL UNIT NOT READY, SELF-TEST IN PROGRESS. While performing a self-test in the background mode, the drive will suspend the self-test to service any other command other than SEND DIAGNOSTIC (with Function Code field set to 100b) WRITE BUFFER (with the mode set to any download microcode option), FORMAT UNIT and START UNIT STOP command. Suspension of the self-test to service the command will occur within 2 seconds. If SEND DIAGNOSTIC (with Function Code field set to 100b), WRITE BUFFER (with the mode set to any download microcode option), FORMAT UNIT or START UNIT STOP command is received, the drive will abort the self-test, update the self-test log, and service the command within two seconds after the command descriptor block has been validated.

An application client may terminate a self-test that is being performed in the background mode by issuing a SEND DIAGNOSTIC command with the Function Code field set to 100b (Abort background self-test function).

#### **Elements common to foreground and background self-test modes**

The Progress Indication field returned in response to a REQUEST SENSE command may be used by the application client at any time during execution of a self-test to poll the progress of the test. While executing a self-test unless an error has occurred, the drive will respond to a REQUEST SENSE command by returning a sense key of NOT READY and an additional sense code of LOGICAL UNIT NOT READY - SELF-TEST IN PROGRESS with the sense key specific bytes set for progress indication.

The application client may obtain information about the twenty most recently completed self-tests by reading the self-test results log page. This is the only method for an application client to obtain information about self-tests performed in the background mode. The default self-test results are not logged in the log page.

#### **Tests performed in the Short and Extended Self-test**

The following table defines the tests performed in the short and extended self test. They are defined by their segment number which is also used to report Self-Test Results, in Log Sense Page 10. Note that the only difference between the Short and the Extended tests, is the sequential verify test in segment 9h. Also note that either of these tests can be run in foreground or back-

ground mode as previously described.

**Table 262: Short and Extended Self-Test Description**

Segment Number	Short Self-Test	Extended Self-Test	Test Description
1h	Drive Ready Test		Internal check to insure drive is “ready”, similar to a Test Unit Ready command.
2h	Drive Diagnostics		This test is comprised of the Default Self Test as defined in Section 21.18.2.1, “Default Self-test” on page 334
3h	SMART		Perform SMART testing and check results to ensure that SMART threshold criteria are not exceeded
4h	Low Level Format check		Check to insure that the media is currently not in the MEDIA FORMAT CORRUPTED state.
5h	Physical Head Check		Write/Read test on each head in a predefined location in the drive's Reserved Area of the disk.
6h	Random Verify		Perform 4000 random verify operations and insure no uncorrectable errors.
7h	- Verify First 300MB - Verify Last 100 MB	Verify all LBA's	Sequential verify operation. Ensure that no uncorrectable errors occur within the verify range.
8h	Recheck SMART		Same as segment 3h.

#### 21.18.2.4 Background Medium Scan

For a related function, see Mode Page 1C (Informational Exceptions Control), page 193

## 21.19 Idle Time Function

The drive periodically saves data in logs and PFA counters in the reserved area of the disks. The information is used by the drive to support various SCSI commands and for the purpose of failure analysis.

## 21.20 Command Time out Limits

The 'Command Time-out Limits' are defined as the time period from the SCSI Arbitration phase through the SCSI Task complete message, associated with a particular command.

The following times are for environments where Automatic Reallocation is disabled and there are no queued commands.

### 21.20.1 Reassignment Time

The drive should be allowed a minimum of 5 seconds to complete a "Reassign Blocks" command.

### 21.20.2 Format Time

Approximately 90/45/25 minutes should be allowed for 300/147/73 GB capacity drives to complete a "Format Unit" command when certification is disabled. Allow 180/90/50 minutes when certification is enabled. If "Fast Format" is enabled via the FFMT bit in mode page 00h, allow 30 seconds for completion.

### 21.20.3 Start/Stop Unit Time

The drive should be allowed a minimum of 30 seconds to complete a "Start Stop Unit" command (with Immed bit = 0). Initiators should also use this time to allow startup sequences initiated by auto start ups and "Start Stop Unit" commands (with Immed bit = 1) to complete and place the drive in a "ready for use" state.

**Note:** A time-out of one minute or more is recommended but NOT required. The larger system time-out limit allows the system to take advantage of the extensive ERP/DRP that the drive may attempt in order to successfully complete the startup sequence.

## 21.20.4 Medium Access Command Time

The time-out limit for medium access commands that transfer user data or non-user data or both should be a minimum of 30 seconds. These commands are

- Pre-Fetch
- Read
- Read Defect Data
- Seek
- Send Diagnostic (Function Code = 0)
- Read Long
- Reassign Blocks
- Write
- Write and Verify
- Write Buffer
- Write Same
- Verify

**Note:** The 30-second limit assumes the absence of bus contention and data transfers of 64 blocks or less. This time should be adjusted for anticipated bus contention and if longer user data transfers are requested.

## 21.20.5 Time-out Limits for Other Commands

The drive should be allowed a minimum of 5 seconds to complete these commands:

- Inquiry
- Log Select
- Log Sense
- Mode Select
- Mode Sense
- Persistent Reserve In/Out
- Read Buffer
- Read Capacity
- Read Long
- Release
- Request Sense
- Reserve
- Set/Report Device Identifier
- Start/Stop Unit (with Immed bit = 1)
- Synchronize Cache
- Test Unit Ready
- Writer Long

The command time-out for a command that is not located at the head of the command queue should be increased by the sum of command time-outs for all of the commands that are performed before it is.

## 21.21 Recommended Initiator ERP

The Drive's design points for error reporting to the system assumes certain system action for the error return codes. These assumptions are:

1. SCSI protocol will be the first priority in reporting errors.
2. The system will maintain a log of all reported errors.
3. System architecture should include all error handling recommendations made in this section. Deviations should have mutual agreement between Drive development and system integration.

This section is directed toward documenting the assumptions made by the Drive that the system is expected to implement. The two error classes that the system should be concerned with are DATA and NON-DATA errors.

Data errors are those errors that deal with the handling of data to and from the MEDIA and are identified by the Additional Sense Code contained in the sense data. The Additional Sense Codes for data errors are as follows:

- OC - Write error
- 11 - Unrecovered read error
- 14 - No record found
- 16 - Data Synchronization mark error
- 17 - Recovered read error without ECC correction
- 18 - Recovered read error with ECC correction

Typically, data errors do not include positioning of the heads or the data path through the electronics.

Nondata errors are those errors that do not have a direct relationship with transferring data to and from the media. Nondata errors can include data handling if the media is not associated with the error (that is, interface error).

The system action assumed for each class of error is outlined here.

### 21.21.1 Drive Service Strategy

The Drive service strategy is defined so the customer will be able to use the system as soon after a failure is detected as possible. The first priority is to replace the entire drive to make the system operational with minimal service time. The service representative should:

1. Back up all the customer data on this drive if possible
2. Replace the complete drive
3. Restore the customer data
4. Return the drive to customer service

## 21.21.2 Recommendations for System Error Log

The system error log should contain information about the Drive error that will allow recovery actions. The system error logs should contain all the error information returned in the sense data. At a minimum, the following information about each error occurrence should be logged.

- Valid bit and error code (Sense byte 0)
- Sense Key (Sense byte 2)
- Information bytes (Sense bytes 3 through 6)
- Command specific information (Sense bytes 8 through 11)
- Additional Sense Code (Sense byte 12)
- Additional Sense Code Qualifier (Sense byte 13)
- Field Replaceable Unit (Sense byte 14)
- Sense Key Specific (Sense bytes 15, 16, and 17)
- Vendor Unique error information (Sense bytes 20 through 23)

## 21.21.3 Data Recovery Procedure

Statistically, most data error activity is noise related and has nothing to do with defects in the media. It is wrong for the system to assume that every data error reported occurred because of a defect in the media. It is also wrong for the system to assume that every data error that occurred because of a media defect rendered the Drive unusable.

Recurring data error activity at the same physical location is an indication of a problem. The problem can be due to a media defect or magnetic damage. A media defect is physical damage to the recording capability of the media while magnetic damage is a defect in the bit pattern written to the media.

In both cases, the error can be corrected without replacing the unit. The physical sector may require relocation. The Drive determines the need to reassign a sector. The Mode Select Page 1 option bit ARRE (See Section 19.10.3, “Mode Page 01 (Read/Write Error Recovery Parameters)” on page 174) set active allows the Drive to relocate recovered read data errors. Non recovered data errors or the ARRE bit being inactive will have additional sense codes returned to recommend reassignment of sectors.

The need to reassign a sector should be infrequent. Sites not meeting error rate criteria are removed from use during SAT (Surface Analysis Test) in Drive manufacturing. With the exception of some early life SAT escapes (sites that were marginally missed during SAT), reassigning defective sectors should be rare. Frequent sector reassignment may be an (early) indication of another type of failure. Sector reassignments are monitored as part of the predictive failure analysis. When a threshold is exceeded, the Drive will notify the initiator that a scheduled service action is required.

Drive soft error rates are based on extraneous random faults that are not predictable. Media defects discovered after the Drive completes manufacturing final test need to be relocated so that soft error rates are not influenced by predictable known error sites. Failure of the system to properly relocate defective media sites can have a direct influence on system throughput and drive error rates.

### 21.21.3.1 Reassign a Physical Sector

The Drive determines the need to reassign physical sectors based on error activity. Once a physical sector requires reassignment, the Drive will either reassign the physical sector, or recommend to the initiator that the LBA associated with the physical sector be reassigned.

When the following Sense Key, Additional Sense Code, and Additional Sense Code Qualifier combinations are returned, the initiator should reassign the LBA reported at the next opportunity.

**Note:** In Table 263, the Key, Code, and Qualifier fields are all hex values (i.e., Sense Key 1 is 1h, Sense Code 17 is 17h, etc.).

**Table 263: Recommend Reassign Errors**

Key	Code	Qual	Description
1	17	07	Recovered Data without ECC - Recommend Reassignment
1	18	05	Recovered Data with ECC - Recommend Reassignment

To reassign an LBA that has sense data recommending a reassignment, the initiator should:

1. Attempt to recover the data from the sector being reassigned with a Read (08) or Read (28) command.
2. Reassign the LBA using the Reassign Blocks (07) command.
  - If the reassignment completes successfully (Good Status), log the error in the system error log.
  - If the reassignment completes unsuccessfully (Check Condition Status), follow the procedure in Section 21.21.3.3, “Reassign Blocks Recovery” on page 342.
3. Write the LBA that was reassigned.

### 21.21.3.2 Data Error Logging

The Drive will report data errors to the initiator that do not require immediate action (successful auto reallocation, successful auto rewrite, or no action needed on this occurrence). The initiator should log these errors in the system error log. No other action is required.

**Table 264: Log Only Errors**

Key	Code	Qual	Description
1	16	00	Data Synchronization Mark Error
1	17	01	Recovered Data with Retries
1	17	06	Recovered Data without ECC - Auto Reallocated
1	17	09	Recovered Data without ECC - Data Rewritten
1	18	00	Recovered Data with ECC
1	18	02	Recovered Data with ECC - Auto Reallocated
1	18	07	Recovered Data with ECC - Data Rewritten

### 21.21.3.3 Reassign Blocks Recovery

The Drive provides the capability to remove media defects without reducing capacity. If the mode parameter bit ARRE is active, the Drive will automatically reallocate LBA's determined to be defective. For those LBA's where the error is unrecoverable or the initiator elects to not have the Drive automatically reallocate LBA's, the Drive will recommend reassignment of the LBA.

Recovery from a failed reassignment consists of the following actions:

- Updating the defect descriptor to remove the LBA's that have been successfully reassigned and then retry the Reassign Blocks command. The LBA contained in the Command Specific Information field of the Sense Data is the LBA in the first defect descriptor that was not reassigned because of the failure. If the command failed because of an unrecoverable read error other than those specified in the defect descriptor, add this LBA to the defect descriptor and retry the command. Refer to Section 19.26, "REASSIGN BLOCKS (07)" on page 238, for additional information.
- If the retried Reassign Blocks (07) command completes successfully, returning to normal processing.
- If the retried Reassign Blocks (07) command fails, servicing the drive using the service guidelines recommended in Section 21.21.1, "Drive Service Strategy" on page 339.

### 21.21.4 Nondata Error Recovery Procedure

The Drive will follow a logical recovery procedure for nondata errors. The initiator options for non-data errors are limited to logging the error, retrying the failing command, or replacing the drive.

These recovery procedures assume the initiator practices data back-up and logs errors at the system level for interrogation by service personnel.

#### 21.21.4.1 Drive Busy

The Drive is busy performing an operation. **This is not an error condition.** The initiator can test for completion of the operation by issuing *Test Unit Ready (00)* (or media access) commands.

- If the *Test Unit Ready (00)* (or media access) command completes with *Check Condition Status* then issue a *Request Sense (03)*
  - If the specified recovery procedure for the sense data is for a condition other than drive busy, follow the recovery procedure for the condition reported.
  - If the specified recovery procedure for the sense data is for a drive busy condition, then continue re-issuing the *Test Unit Ready (00)* and *Request Sense* commands for the duration of a media access time-out or until the drive returns *Good Status*.
  - If the drive has been busy for longer than the limit specified in Section 21.20, "Command Time out Limits" on page 337, then service the drive using the service guidelines recommended in Section 21.21.1, "Drive Service Strategy" on page 339. Otherwise return to normal processing.
- If the *Test Unit Ready (00)* (or media access) command completes with *Good Status*, then return to normal processing.

#### 21.21.4.2 Unrecovered Drive Error

The initiator should retry the failing command.

1. If the retry of the failing command completes with *Good Status* or recovered Sense Key, follow the recovery procedure in Section 21.21.4.3, "Recovered Drive Error" on page 343.
2. If the retry of the failing command completes with hardware error sense, verify there is no outside cause (e.g., power supply) for the failure, then retry the failing command.
  - a. If the retry of the failing command completes with *Good Status*, follow the recovery procedure in next Section 21.21.4.3, "Recovered Drive Error" on page 343.
  - b. If the retry of the failing command completes with Recovered sense or Hardware error sense, then service the drive using the service guideline recommended in Section 21.21.1, "Drive Service Strategy" on page 339.

### 21.21.4.3 Recovered Drive Error

The Initiator should log the error as soft with the recovery level.

### 21.21.4.4 Drive Not Ready

The initiator should do the following:

1. Issue a *Start Stop Unit (1B)* command.
2. Verify that the drive comes ready within the time specified in Section 4.5.2, “Drive ready time” on page 13.
3. If the drive fails to come ready within the specified time, service the drive using the service guidelines specified in Section 21.21.1, “Drive Service Strategy” on page 339.
4. Retry the failing command.
  - a. If the failing command completes with *Good Status*, log the error as recovered.
  - b. If the failing command completes with Not Ready sense, verify there is no outside cause (for example, the power supply). Then service the drive using the service guidelines specified in Section 21.21.1, “Drive Service Strategy” on page 339.

### 21.21.4.5 No Defect Spare

Three conditions can cause this error:

1. When the *Reassign Blocks (07)* command is issued and there are no spares available for the Drive to use for the relocation requested.
2. When the Glist is full and the sector to be reassigned cannot be added.
3. During a format operation, there was not enough space available to fulfill the spare requirement (Dlist is too large).

Service the Drive following Section 21.21.1, “Drive Service Strategy” on page 339.

### 21.21.4.6 Degraded Mode

Refer to Section 21.6.9, “Degraded Mode” on page 320, for the definition of this state. There are three causes for entering degraded mode. In all cases the Sense Key is *Not Ready*. The causes are the following:

1. Sense Code/Qualifier of *Logical Unit Not Ready, initializing command required*. The spindle motor not spinning or not at the proper speed. This may not be an error condition. The initiator should issue a *Unit start (1B)* command to start the spindle motor. If the Drive fails to come ready in the time specified in Section 21.20, “Command Time out Limits” on page 337, service the drive using the service guideline recommended in Section 21.21.1, “Drive Service Strategy” on page 339.
2. Sense Code/Qualifier of *Diagnostic Failure*. Failure of a Send Diagnostic self test, a start up sequence, or other internal target failures.
  - Failure of a send diagnostic self test or a start up sequence.

This failure is the result of the diagnostics that are executed during power on or when the *Send Diagnostic (1D)* command is executed detecting a failure. As with the RAM code not loaded and the configuration data not loaded, the recovery is either a power cycle or issuing the *Send Diagnostic (1D)* command with the self test bit set active. Recovery for a failed Send Diagnostic (1D) is achieved in one of the following ways:

Executing the Send Diagnostic (1D) command

Power cycling the drive

If the failure repeats, service the drive using the service guideline recommended in Section 21.21.1, “Drive Service Strategy” on page 339.

Recovery for a failed power up sequence is achieved in one of the following ways:

Issuing a Unit start (1B) command

Power cycling the drive.

If the failure repeats, service the drive using the service guideline recommended in Section 21.21.1, “Drive Service Strategy” on page 339.

- Internal target failures

The drive periodically adjusts the track following for each head to compensate for expansion and contraction of the disks due to temperature changes. If one of these adjustments fails, the drive will enter a degraded mode to prevent writing data off track.

Recovery of this condition is either a power cycle or successful completion of the Send Diagnostic (1D). Service the drive using the recommended service guidelines specified in Section 21.21.1, “Drive Service Strategy” on page 339, if the power cycle or the Send Diagnostic (1D) command fail to complete successfully.

3. Sense Code/Qualifier of **Format Command Failed** Format Unit (04), Sense Code/Qualifier of **Medium Format Corrupted Reassign Failed** Reassign Blocks (07) command, or an automatic reallocation failed or was abnormally terminated.

Recovery from a failed Format Unit (04) is achieved by retrying the command. If the command fails a second time, service the drive following the procedure defined in Section 21.21.1, “Drive Service Strategy” on page 339.

If the above defined recovery procedures fail to clear the degraded mode condition, the Drive should be replaced. Follow the procedure in Section 21.21.1, “Drive Service Strategy” on page 339, when replacing the drive.

#### 21.21.4.7 Reserved Area Hard Error

Sectors found defective in the reserved area of the disk cannot be reassigned after the Drive leaves the factory. The data in the reserved area is not directly accessible by the initiator. For this reason, the reserved area has all data. A data error must occur in both copies of the data record before the Drive considers a reserved area read error. When this happens, the integrity of the drive is questionable.

Service the Drive using Section 21.21.1, “Drive Service Strategy” on page 339.

#### 21.21.4.8 Interface Protocol

For all interface protocol errors, the initiator should complete the following steps:

1. Correct the parameter that caused the Illegal Request
2. Retry the failing command
3. If the first retry of the failing command completes with
  - *Good Status*, log the error as recovered
  - *Check Condition Status* with sense data for an Illegal Request, verify there is no outside cause (for example, the power supply) for the failure
  - *Other*, follow the recommendations for the error condition reported. Retry the failing command. If this retry of the failing command completes with
    - *Good Status*, log the error as recovered
    - *Check Condition Status* with sense data for an Illegal Request, service the drive using the service guideline recommended in Section 21.21.1, “Drive Service Strategy” on page 339.
    - *Other*, follow the recommendations for the error condition reported.

#### 21.21.4.9 Aborted Command

The initiator should determine the cause from the Additional Sense Code (byte 12):

- Sense Key = B (Aborted Command) with Additional Sense Codes of 1B, 25, 43, 49, and 4E are initiator caused abort conditions. The initiator should correct the condition that caused the abort and retry the failing command.
- Sense Key = B (Aborted Command) with Additional Sense Code of 44 or 48 are drive caused abort conditions. The initiator should:
  1. Retry the failing command.
  2. If the retry of the failing command completes with

- *Good Status*, log the error as recovered.
- Abort Command Sense, verify there is no outside cause (e.g. power supply) for the failure.
- 3. Retry the failing command.
- 4. If the retry of the failing command completes with
  - *Good Status*, log the error as recovered.
  - Abort command sense, then service the drive using the service guideline recommended in Section 21.21.1, “Drive Service Strategy” on page 339.
- Sense Key = B (Aborted Command) and an Additional Sense Code of 47 can be an initiator or Drive caused abort condition. The initiator should follow the above procedure for initiator caused abort conditions if the Drive detected the SCSI bus parity error. The initiator should follow the above procedure for Drive caused abort conditions if the initiator detected the SCSI bus parity error.

#### **21.21.4.10 Unit Attention Condition**

Unit Attention Conditions are not errors. They alert the initiator that the drive had an action that may have changed an initiator controlled state in the drive. These conditions are the following:

##### **Not Ready to Ready Transition**

Not ready to ready transition, unit formatted. This *Unit Attention Condition* will not be reported to the initiator that issued the *Format Unit (04)*.

##### **Reset**

Reset - This means the drive was reset by either a power-on reset, LIP Reset, Target Reset or an internal reset.

##### **Mode Parameters Changed**

A *Mode Select (15)* command successfully completed. This means that the mode parameters that are the current value may have changed. The parameters may or may not have changed but the command to change the parameters successfully completed. The Drive does not actually compare the old current and the new current parameters to determine if the parameters changed. This *Unit Attention Condition* will not be reported to the initiator that issued the *Mode Select (15)*.

##### **Microcode Has Changed**

*Write Buffer (3B)* to download microcode has successfully completed. This means that the microcode that controls the Drive has been changed. The code may or may not be the same as the code currently being executed. The Drive does not compare old level code with new code.

##### **Commands Cleared by Another Initiator**

Tagged commands cleared by a clear queue message. This means that the command queue has been cleared. The *Unit Attention Condition* is not reported to the initiator that issued the clear queue message. *Unit Attention Condition* is reported to all initiators that had commands active or queued.

Reissue any outstanding command.

##### **Log Select Parameters Changed**

A Log Select (4C) command successfully completed. This means that the Log Select command cleared statistical information successfully (See Section 19.6, “LOG SELECT (4C)” on page 137). Unit Attention Condition is reported to all initiators excluding the initiator that issued the Log Select command.

##### **Device Identifier Changed**

A Set Device Identifier (A4) command successfully completed. This means that the Set Device Identifier information field has been updated. (See 19.41, “SET DEVICE IDENTIFIER (A4/06)” on page 268) A Unit Attention Condition is reported to all initiators excluding the initiator that issued the Set Device Identifier command.

#### 21.21.4.11 Components Mismatch

The compatibility test is performed at a power cycle. The compatibility test verifies the microcode version of the electronics. When the Drive detects the microcode version mismatch, the most likely cause is the result of incorrect parts used during a service action.

If the error reported is Key/code/qualifier 4/40/80, Diagnostic failure, bring-up fail, the initiator should do the following:

1. Retry Power cycle
2. Check the send diagnostic end status. If the status is
  - GOOD, Return to normal processing
  - *Check Condition Status*, issue a *Request Sense (03)* and follow the recommendations for the sense data returned unless the sense data is for a component mismatch. If the sense data is for component mismatch, service the drive using the service guideline recommended in Section 21.21.1, “Drive Service Strategy” on page 339.

#### 21.21.4.12 Self Initiated Reset

The Drive will initiate a self reset when the condition of the Drive cannot be determined. The internal reset will terminate any outstanding commands, release any reserved initiators, and stop the spindle motor. The initiator can recover by

1. Logging the error
2. Retrying the failing command. If the failing command completes with:
  - *Good Status*, return to normal processing
  - Self initiated reset sense, service the drive according the guidelines recommended in Section 21.21.1, “Drive Service Strategy” on page 339.
  - Other, follow the recommendations for the error reported.

#### 21.21.4.13 Defect List Recovery

**This is not an error condition.**

The initiator either requested a defect list in a format (block or vendor specific) that the Drive does not support or the requested defect list(s) exceed the maximum list length that can be returned. If the Sense Key/Code/Qualifier are:

1/1F/00, the requested list(s) exceed the maximum length that can be supported. The initiator should request one list at a time. If a single list exceeds the maximum returnable length, this may be an indication of a marginally operational drive. Service the drive following the service guidelines in Section 21.21.1, “Drive Service Strategy” on page 339.

1/1C/01 or 1/1C/02, the requested defect list is not in the format that the Drive supports. The requested defect list is returned in the physical (cylinder, sector, head) format. This is the default format. There is no initiator action required for this condition.

#### 21.21.4.14 Mismatch Recovery

A mismatch can occur on a *Verify (2F)* command or a *Write and Verify (2E)* with the byte check (BytChk) bit active. Recovery for a mismatch error is different for the two commands.

##### Verify Command

The initiator should do the following:

1. Verify that the data sent to the drive is the correct data for the byte-by-byte compare.
2. Read the data from the media with a *Read (08)* or *Read (28)* command and verify that the data from the media is the expected data for the byte-by-byte compare.
  - If all data are correct, this is an indication that the data may have been read from the media incorrectly without an error detected. Service the drive using the procedure specified in Section 21.21.1, "Drive Service Strategy" on page 339.
  - If all data are not correct, this is an indication that the data on the media is not the data the initiator expected. Rewrite the correct data to the media.

##### Write and Verify Command

The drive uses the same data in the data buffer to write then read and compare. A mismatch error on the *Write and Verify (2E)* command is an indication that the drive cannot reliably write or read the media. Service the drive using the procedures specified in Section 21.21.1, "Drive Service Strategy" on page 339.

#### 21.21.4.15 Microcode Error

The microcode from the interface is validated before the device operates using that microcode. When the validation detects incorrect or incomplete data, the Drive enters degraded mode.

If the initiator attempted to load microcode using the *Write Buffer (3B)* retry the *Write Buffer (3B)*. If the command completes with

- *Good Status* - return to normal processing
- *Check Condition Status* - service the drive using the service guidelines recommended in Section 21.21.1, "Drive Service Strategy" on page 339.

If the check sum error occurred during normal processing, the initiator may attempt to load microcode before deciding to service the drive using the service guidelines recommended in Section 21.21.1, "Drive Service Strategy" on page 339.

To load new microcode, the initiator should issue a *Write Buffer (3B)* command with the download and save option. If the *Write Buffer (3B)* command completes with

- Good Status, return to normal processing. Retry the failing command. If the task complete with
  - Good Status - Continue normal processing.
  - Check Condition Status for check sum error - Service the drive using the service guidelines recommended in Section 21.21.1, "Drive Service Strategy" on page 339.
  - Check Condition Status for any other error - follow the recommended recovery procedure for the error reported.
- Check Condition Status for Check sum error, service the drive using the service guidelines recommended in Section 21.21.1, "Drive Service Strategy" on page 339.
- Check Condition Status for any other error, follow the recommendations for the returned sense data.

#### **21.21.4.16 Predictive Failure Analysis**

The Drive performs error log analysis and will alert the initiator of a potential failure. The initiator should determine if this device is the only device with error activity.

If this drive is the only drive attached to the initiator with error activity, service the drive using the procedures specified in Section 21.21.1, “Drive Service Strategy” on page 339.

**Note:** Service for this drive can be deferred. The longer service is deferred, the more probable a failure can occur that will require immediate service.

If more than this drive is experiencing error activity, the drive is probably not at fault. Locate and service the outside source causing error activity on this drive.

## 22.0 SCSI Sense Data

### 22.1 SCSI Sense Data Format

Format of the sense data returned by the drive in response to the REQUEST SENSE command.

**Table 265: Format of Sense Data.**

Byte	Bit							
	7	6	5	4	3	2	1	0
0	Valid	Error Code (70h or 71h)						
1	RSVD = 0							
2	0	ILI	0	Sense Key				
3-6	(MSB)	Information Bytes						(LSB)
7	Additional Sense Length							
8-11	(MSB)	Product Specific Information						(LSB)
12	Additional Sense Code							
13	Additional Sense Code Qualifier							
14	FRU = 0							
15	SKSV	Sense-Key Specific Bits						
16-17	Sense-Key Specific Bytes							
18-19	Reserved = 0							
20-23	Vendor unique Error information							
24-29	Product Specific Information							
30-31	Reserved = 0							

## 22.2 Sense Data Description

### 22.2.1 Valid (Bit 7 of byte 0)

- 0 The Information Bytes (byte 3 through 6) are not defined.
- 1 The Information Bytes (byte 3 through 6) contain a valid logical block address.

### 22.2.2 Error Code (Bit 6 - 0 of byte 0)

- 70h Current Error. This indicates an error for the current command.
- 71h Deferred Error. This indicates that the error is for a previous command that has already returned a good status. Such commands are associated with the immediate bit or write caching. Format unit (04h) command is an example of a command that may return a deferred error.

### 22.2.3 ILI: Incorrect Length Indicator (Bit 5 of byte 2)

The ILI bit is valid for the Read Long (3Eh) command and Write Long (3Fh) command only. ILI set to one and Valid Bit set to one indicates that the requested logical block length does not match the logical block length of the data on the medium for a Read Long or Write Long command. The Information field contains residue information about the error. ILI set to zero indicates there is no incorrect length condition.

- 0 No Incorrect Length condition.
- 1 Incorrect Length Indicated.

Valid	ILI	Command = Read Long or Write Long?	Description
x	0	x	No incorrect length condition
1	1	yes	Requested Logical block Length does not match the logical block length of the data on the disk

## 22.2.4 Sense Key (Bit 3 - 0 of byte 2)

The sense key provides generic categories in which error and exception conditions can be reported. Initiators would typically use sense keys for high level error recovery procedures.

<b>0h</b>	<b>No Sense</b>	There is no sense key information to be reported for the logical unit.
<b>1h</b>	<b>Recovered Error</b>	The last command completed successfully with some recovery action performed by the drive. More detailed information is available in the Additional Sense Code and Additional Sense Code Qualifier.
<b>2h</b>	<b>Not Ready</b>	The logical unit addressed cannot be addressed. More detailed information is available in the Additional Sense Code and Additional Sense Code Qualifier.
<b>3h</b>	<b>Medium Error</b>	The command terminated with an unrecoverable error condition caused by a flaw in the media or an error in the recorded data. More detailed information is contained in the Additional Sense Code and Additional Sense Code Qualifier.
<b>4h</b>	<b>Hardware Error</b>	The drive detected an unrecoverable hardware error while performing a command or during a diagnostic test. More detailed information is contained in the Additional Sense Code and Additional Sense Code Qualifier.
<b>5h</b>	<b>Illegal Request</b>	There was an illegal parameter in the command descriptor block or additional parameter supplied as data. If an invalid parameter is found in the CDB, then the command is terminated without altering the medium. If an invalid parameter is found in parameters supplied as data, then the drive might have altered the medium.
<b>6h</b>	<b>Unit Attention</b>	Indicates that the drive entered in the 'Unit Attention Condition'. (See Section 21.6.5, "Unit Attention Condition" on page 317)
<b>7h</b>	<b>Data Protect</b>	
<b>8h</b>	<b>Not used</b>	
<b>9h</b>	<b>Vendor Specific</b>	
<b>Ah</b>	<b>Not used</b>	
<b>Bh</b>	<b>Aborted command</b>	The drive aborted the command.
<b>Ch-Dh</b>	<b>Not Implemented</b>	
<b>Eh</b>	<b>Miscompare</b>	
<b>Fh</b>	<b>Reserved</b>	

## 22.2.5 Information Bytes (Byte 3 through 6)

This field is only valid when Valid Bit is one.

- **ILI = 0:** This field contains the unsigned LBA associated with the sense key. The LBA reported will be within the LBA range of the command as defined in the CDB.

**Note:** An LBA other than the command LBA may be reported on the Reassign Block (07h) command.

- **ILI = 1:** This field contains the difference (residue) of the requested length in bytes. Negative values are indicated by two's complement notation.

Valid	ILI	Description
0	x	0x00000000 - (not used/invalid)
1	0	LBA
1	1	Residue of the requested length in bytes

## 22.2.6 Additional Sense Length (Byte 7)

Indicates the remaining number of bytes in the sense data. (It is always set to 18h.)

## 22.2.7 Command Specific Information (Byte 8 through 11)

This field is unused and will be set to zero.

## 22.2.8 Additional Sense Code/Qualifier (Byte 12 and 13)

The following table shows the description of the combination of Sense Key / Sense Code / Qualifier.

### Valid Sense Key, Code, Qualifier Combinations Used by the Drive.

Key	Code	Qual	Description
Sense Key = No Sense			
<b>0</b>	<b>00</b>	<b>00</b>	<b>No Additional Sense Information</b> (00 00) No Error.
Sense Key = Recovered Error			
<b>1</b>	<b>01</b>	<b>00</b>	<b>No Index/Sector Signal</b> 1413 Servo: Soft write no index error
<b>1</b>	<b>02</b>	<b>00</b>	<b>No Seek Complete</b> 141B Servo: Recovered No seek complete 141D Servo: Recovered Seek timeout 141F Servo: Recovered Seek error 142B Servo: Recovered RRO Calibration timeout
<b>1</b>	<b>03</b>	<b>00</b>	<b>Peripheral Device Write Fault</b> 1405 Servo: Recovered write inhibit error 1733 Recovered read/write abort 1737 Recovered post write abort 1739 Recovered Post PES check write abort 17E0 Servo Recovered read/write abort estimator error 17E2 Servo Recovered read/write abort predictor error 17E4 Servo Recovered read/write abort PES error 17E6 Servo Recovered read/write abort seek start error 17E8 Servo Recovered read/write abort PES reset error 17EA Servo Recovered read/write abort abort WCS other error 17EC Servo Recovered read/write abort WCS other error 17EE Servo Recovered read/write abort hard reset 17F0 Servo Recovered read/write abort RV sensor error 17F2 Servo Recovered read/write abort RV sensor error 17F4 Servo Recovered read/write abort SHARP other error 17F6 Servo Recovered read/write abort SHARP exception error 17F8 Servo Recovered read/write abort SVGA limit error 17FA Servo Recovered read/write abort gray code error 17FC Servo Recovered read/write abort burst error 17FE Servo Recovered read/write abort no STM error
<b>1</b>	<b>09</b>	<b>00</b>	<b>Track Following Error</b> 1421 Servo: Recovered track following error 1423 Servo: Recovered track follow timeout

1	0B	01	<b>Temperature Warning Error</b> xA02 Temperature Warning
1	0B	03	<b>Background Selftest Failure Warning</b> xA03 Background selftest failure warning
1	0B	04	<b>Background Pre-Scan Failure Warning</b> xA04 Background pre-scan failure warning
0	0B	05	<b>Background Media Scan Failure Warning</b> xA05 Background media scan failure warning
1	0C	01	<b>Recovered Write Error with Auto Reallocation - Auto Reallocated</b> D703 Auto-reallocated due to write error
1	0C	03	<b>Recovered Write Error - Recommend Reassignment</b> 1704 Recommend reassign due to write error
1	15	00	<b>Random Positioning Error</b> 1714 Recovered sector overflow 173D Recovered sector miss 1770 Recovered SID timeout 17B2 Recovered abort window error
1	16	00	<b>Data Synchronization Mark Error</b> 173B Recovered data address mark error
1	16	01	<b>Data Sync Error - Data Rewritten</b> E70E Recovered Data Address Mark error - rewritten
1	16	02	<b>Data Sync Error - Recommend Rewrite</b> E70F Recovered Data Address Mark error - recommend rewrite
1	16	03	<b>Data Sync Error - Auto Reallocated</b> D710 Recovered Data Address Mark error - reassigned
1	16	04	<b>Data Sync Error - Recommend Reassignment</b> E711 Recovered Data Address Mark error - recommend reassign
1	17	01	<b>Recovered Data with Retries</b> 1722 Recovered small thermal asperity 172C Recovered media error 172E Recovered media error (off-line correction discarded)
1	17	06	<b>Recovered Data Without ECC - Data Auto-Reallocated</b> E705 Media error with OTF correction - reassigned D72B Recovered thermal asperity - reassigned
1	17	07	<b>Recovered Data Without ECC - Recommend Reassignment</b> E706 Media error with OTF correction - recommend reassign E72A Recovered thermal asperity - recommend reassign
1	17	08	<b>Recovered Data Without ECC - Recommend Rewrite</b> E707 Media error with OTF correction - recommend rewrite E729 Recovered thermal asperity - recommend rewrite

<b>1</b>	<b>17</b>	<b>09</b>	<b>Recovered Data Without ECC - Data Rewritten</b> D708 Media error with OTF correction - rewritten E728 Recovered thermal asperity - rewritten
<b>1</b>	<b>18</b>	<b>00</b>	<b>Recovered Data With ECC</b> 1709 Media error with offline correction
<b>1</b>	<b>18</b>	<b>02</b>	<b>Recovered Data - Data Auto-Reallocated</b> D70A Media error with offline correction and reassign D724 Recovered thermal asperity with offline correction - reassigned
<b>1</b>	<b>18</b>	<b>05</b>	<b>Recovered Data - Recommend Reassignment</b> E70B Media error with offline correction and recommend reassign E725 Recovered thermal asperity with offline correction - recommend reassign
<b>1</b>	<b>18</b>	<b>06</b>	<b>Recovered Data With ECC - Recommend Rewrite</b> E70C Media error with offline correction - recommend rewrite E726 Recovered thermal asperity with offline correction - recommend rewrite
<b>1</b>	<b>18</b>	<b>07</b>	<b>Recovered Data With ECC - Data Rewritten</b> E70D Media error with offline correction - rewritten E727 Recovered thermal asperity with offline correction - rewritten
<b>1</b>	<b>1C</b>	<b>00</b>	<b>Defect List Format Not Supported</b> 1746 Defect list format not supported

## 22.2.9 RU: Field Replaceable Unit (Byte 14)

The FRU (Field Replaceable Unit) field value will always be zero.

## 22.2.10 Sense Key Specific (Byte 15 through 17)

The definition of this field is determined by the value of the sense key field.

### 22.2.10.1 Sense Key Specific - Illegal Request (Sense Key = 5h)

Error field pointer is returned.

**Table 266: Field Pointer Bytes**

Byte	Bit							
	7	6	5	4	3	2	1	0
15	SKSV	C/D	Reserved		BPV	Bit Pointer		
16 17	(MSB) Field Pointer							(LSB)

**SKSV** Sense-key specific valid

**0** Sense-key specific field is not valid.

**1** Sense-key specific field is valid.

**C/D** Command/Data

**0** Indicates that the illegal parameter was in the data parameters sent by the initiator during DATA OUT phase

**1** Indicates that the illegal parameter was in the command descriptor block.

**BPV** Bit Pointer Valid

**0** Bit pointer field is not valid.

**1** Bit pointer field is significant.

**Bit Pointer** Indicates which bit of the byte number reported in Field Pointer is the bit in error. When a multiple bit field is in error, the pointer points to the most significant bit of the field.

**Field Pointer** Indicates which bytes of the command descriptor block or of the parameter data were in error. Bytes are numbered starting from zero, as shown in the tables describing the commands and parameters. When a multiple byte field id is in error, the pointer points to the most significant byte of that field.

### 22.2.10.2 Sense Key Specific - Recovered (Sense Key = 1h) or Medium (Sense Key = 3h) or Hardware (Sense Key = 4h)

Hardware (Sense Key = 4h) or Medium Error (Sense Key = 3h)

Actual Retry Count is reported.

**Table 267: Actual Retry Count**

Byte	Bit							
	7	6	5	4	3	2	1	0
15	SKSV	Reserved						
16	Secondary Step				ERP Type			
17	Actual Retry Count							

**SKSV**

Sense-key specific valid

**0** Actual Retry Count is not valid.

**1** Actual Retry Count is valid.

**Actual Retry Count**

Number of retry steps used in attempting to recover from the error condition.

**Secondary Step**

Secondary error recovery step (valid for servo errors only).

**ERP Type**

Error recovery table branch for this error. Valid values are shown in the table below.

Recovery Type	ERP Type
Read	0x00
Verify	0x01
Write	0x02
Seek	0x03
Read, Sync Byte branch	0x04
Read, Thermal Asperity branch	0x05
Read, Minus Mod branch	0x06
Verify, Sync Byte branch	0x07
Verify, Thermal Asperity branch	0x08
Verify, Minus Mod branch	0x09

### 22.2.10.3 Sense Key Specific - Not Ready (Sense key = 2h)

These fields are defined for the Format unit (04h) command with the Immediate bit set to one and the Send Diagnostic (1Dh) command with Background self-test function.

Progress indication is returned.

**Table 268: Progress Indication**

Byte	Bit							
	7	6	5	4	3	2	1	0
15	SKSV	Reserved						
16 17	(MSB)	Progress Indication						(LSB)

**SKSV**

Sense-key specific valid

**0** Progress Indication is not valid.

**1** Progress Indication is valid.

**Progress Indication**

Indicates a percent complete in which the returned value is the numerator that has 10000h as its denominator.

### 22.2.11 Reserved (Byte 18 through 19)

Reserved fields are filled with zero.

### 22.2.12 Vendor unique error information (Byte 20 through 23)

This field gives detailed information about the error. It contains a unique code which describes where the error was detected and which piece of hardware or microcode detected the error depending on current operation.

### 22.2.13 Physical Error Record (Byte 24 thru 29)

- ILI = 1 - This field contains zeros.
- ILI = 0 - These bytes contain the physical location of the error in cylinder, head, and sector. Bytes 24, 25, and 26 are cylinder high, middle and low bytes respectively, of the cylinder number. Byte 27 is the head number. Bytes 28 and 29 are the the high and low bytes, respectively of the sector number.

If the head is undetermined, bytes 24, 25, and 26 are set to 0FFFFFFh. If the head number is undetermined, byte 27 is set to 0FFh. If cylinder, head, and sector have no relevance the the error, bytes 24 through 29 will all be set to 0FFFFFFFFFFFFh for Valid = 0 and ILI = 0. This Physical Error Record field is valid for Sense Key 1, 3, and 4 only.

Valid	ILI	Description
1	0	Cylinder Number (bytes 24-26) Head number (byte 27) Sector Number (bytes 28-29)
1	1	0x000000000000
0	x	0x000000000000 - (not used/invalid)

### 22.2.14 Reserved (Byte 30 through 31)

Reserved fields are filled with zero.

## 23.0 Appendix. UEC list

Following is the list of Unit Error Codes and associated descriptions. The Unit Error Codes are returned by the target in sense data bytes 20-21.

The list of Unit Error Codes and descriptions does not have a direct correlation to the error descriptions and Sense Key/Code/Qualifier descriptions in Section 22.0, “SCSI Sense Data” on page 349. These codes are used internally by Hitachi and may change without notice.

### How to find a specific UEC

The first hex digit of the UEC indicates the error severity, e.g. Fxxx codes are for hard/unrecoverable errors, 1xxx codes are for soft/recoverable errors, etc. The second hex digit indicates the grouping, e.g. interface, media, servo, etc. types of errors. The table is sorted without regard to the first hex digit; instead, sorting is by the least significant three hex digits.

**Table 269: Unit Error Codes**

UEC	Description
----	-----
0000	No error
F101	BATS error: Reserved Area - Invalid request
F102	BATS error: Reserved Area - Broken
F103	BATS error: Reserved Area - Invalid version
F104	BATS error: Reserved Area - Invalid checksum
F105	BATS error: Reserved Area - Invalid eyecatcher
F106	BATS error: Reserved Area - Invalid main header checksum
F107	BATS error: Reserved Area - Invalid read length
F108	BATS error: Reserved Area - Address boundary error
1109	BATS error: Reserved Area - Error reading first copy
110A	BATS error: Reserved Area - Error reading second copy
F10B	BATS error: Reserved Area - Read block error
110C	BATS error: Reserved Area - Write fix soft error
F10D	BATS error: Reserved Area - Write fix hard error
F10E	BATS error: Directory broken
F10F	BATS error: Overlay code load error
F110	BATS error: Overlay code check
F111	BATS error: RAM code load error
F112	BATS error: RAM code check
F113	BATS error: Config invalid
F114	BATS error: Log manager invalid
F115	BATS error: Media tables invalid
F116	BATS error: Logical-to-physical invalid
F117	BATS error: Defect manager invalid
F118	BATS#2 error: Seek test error
F119	BATS#2 error: Read/write test error
F11A	BATS#2 error: ECC test error
F11B	BATS#2 error: CRC test error

UEC	Description
F11C	BATS#2 error: XOR test error
F11D	Incorrect Disk Code
F11F	RPO SID invalid
F120	BATS error: Code Compatibility Failure
F121	BATS error: Code download in progress
F122	BATS error: Performance data read error
F123	Invalid request to enter sleep mode
F124	Bring-up error
F125	BATS error: Invalid RID/FID
F126	BATS error: Code checksum error
F127	BATS error: Invalid header
F128	DRAM test in progress
F129	DRAM test complete
F12A	DRAM test error
F12B	BATS error: Reserved area - invalid model
F12C	BATS error: Invalid code size
F130	Incorrect Customer Code
F131	Flash timeout
F132	GEM FH track read error
F133	BATS error: Vendor ID mismatch
F134	Head Health Check data compare error
F135	Head Health Check unrecovered media error
F136	BATS#2 error: End-To-End Data Protection error
1201	Error in UEC class
1202	Error in UEC cause
F203	Internal target failure
F204	Reassign reserved area media error
F205	G-list full - can't reassign any more sectors
F206	No spares available
F207	AHB Access Error
1301	Motor: Recovered internal error
F302	Motor: Unrecovered internal error
1303	Motor: Recovered Open Loop Commutation failure
F304	Motor: Unrecovered Open Loop Commutation failure
1305	Motor: Recovered No feedback detected error
F306	Motor: Unrecovered No feedback detected error
1307	Motor: Recovered Settle timeout
F308	Motor: Unrecovered Settle timeout
1309	Motor: Recovered Gross speed error

UEC	Description
F30A	Motor: Unrecovered Gross speed error
130B	Motor: Recovered 12V OK error
F30C	Motor: Unrecovered 12V OK error
130D	Motor: Recovered Speed error
F30E	Motor: Unrecovered Speed error
130F	Motor: Recovered Spindle Current error
F310	Motor: Unrecovered Spindle Current error
1311	Moto: Recovered Internal 12V not OK timeout
F312	Motor: Unrecovered Internal 12V not OK timeout
1313	Motor: Recovered Inductive Sense measurement timeout
F314	Motor: Unrecovered Inductive Sense speed error
F315	Motor: Recovered Spin Sense speed error
F316	Motor: Unrecovered Spin Sense speed error
1317	Motor: Recovered Spin Sense timeout
F318	Motor: Unrecovered Spin Sense timeout
1319	Motor: Recovered Target speed error
F31A	Motor: Unrecovered Target speed error
131B	Motor: Recovered Power driver version error
F31C	Motor: Unrecovered Power driver version error
131D	Motor: Recovered Over current error
F31E	Motor: Unrecovered Over current error
131F	Motor: Recovered System clock watchdog error
F320	Motor: Unrecovered System clock watchdog error
1321	Motor: Recovered Negative regulator fault
F322	Motor: Unrecovered Negative regulator fault
1323	Motor: Recovered Module overtemp error
F324	Motor: Unrecovered Module overtemp error
1325	Motor: Recovered 12V or 5V OK error
F326	Motor: Unrecovered 12V or 5V OK error
1327	Motor: Recovered unknown error
F328	Motor: Unrecovered unknown error
1329	Motor: Recovered VCM DAC watchdog error
F32A	Motor: Unrecovered VCM DAC watchdog error
1401	Servo: Recovered Requested rezero head does not exist
F402	Servo: Unrecovered Requested rezero head does not exist
1403	Servo: Recovered Back EMF movement in progress
F404	Servo: Unrecovered Back EMF movement in progress
1405	Servo: Recovered Back EMF timeout error
F406	Servo: Unrecovered Back EMF timeout error
1407	Servo: Recovered ADC conversion timeout

UEC	Description
F408	Servo: Unrecovered ADC conversion timeout
1409	Servo: Recovered Load/unload calibration error
F40A	Servo: Unrecovered Load/unload calibration error
140B	Servo: Recovered Invalid 5 volts
F40C	Servo: Unrecovered Invalid 5 volts
140D	Servo: Recovered Invalid 12 volts
F40E	Servo: Unrecovered Invalid 12 volts
140F	Servo: Recovered Invalid harmonic requested
F410	Servo: Unrecovered Invalid harmonic requested
1411	Servo: Recovered Gain BEMF Calibration error
F412	Servo: Unrecovered Gain BEMF Calibration error
1413	Servo: Recovered VOFF BEMF calibration error
F414	Servo: Unrecovered VOFF BEMF calibration error
1415	Servo: Recovered Invalid temperature
F416	Servo: Unrecovered Invalid temperature
1417	Servo: Recovered Truncated rezero
F418	Servo: Unrecovered Truncated rezero
1419	Servo: Recovered Heads not loaded
F41A	Servo: Unrecovered Heads not loaded
141B	Servo: Recovered No seek complete
F41C	Servo: Unrecovered No seek complete
141D	Servo: Recovered Seek timeout
F41E	Servo: Unrecovered Seek timeout
141F	Servo: Recovered Seek error
F420	Servo: Unrecovered Seek error
1421	Servo: Recovered Track following error
F422	Servo: Unrecovered Track following error
1423	Servo: Recovered Track follow timeout
F424	Servo: Unrecovered Track follow timeout
1425	Servo: Recovered KT Seek out of range
F426	Servo: Unrecovered KT Seek out of range
1427	Servo: Recovered DAC Offset calibration error
F428	Servo: Unrecovered DAC Offset calibration error
1429	Servo: Recovered Load speed error
F42A	Servo: Unrecovered Load speed error
142B	Servo: Recovered RRO Calibration timeout
F42C	Servo: Unrecovered RRO Calibration timeout
142D	Servo: Recovered ADC Calibration error
F42E	Servo: Unrecovered ADC Calibration error
142F	Servo: Recovered ADC Offset error
F430	Servo: Unrecovered ADC Offset error

UEC	Description
1431	Servo: Recovered ADC Limit error
F432	Servo: Unrecovered ADC Limit error
1433	Servo: Recovered Balancer Resistance error
F434	Servo: Unrecovered Balancer Resistance error
1435	Servo: Recovered Balancer Resistance Limit error
F436	Servo: Unrecovered Balancer Resistance Limit error
1437	Servo: Recovered First Cylinder error
F438	Servo: Unrecovered First Cylinder error
1439	Servo: Recovered Valid Cylinder error
F43A	Servo: Unrecovered Valid Cylinder error
143B	Servo: Recovered ADC Saturation error
F43C	Servo: Unrecovered ADC Saturation error
143D	Servo: Recovered Latch Break timeout
F43E	Servo: Unrecovered Latch Break timeout
143F	Servo: Recovered MR Resistance out of range error
F440	Servo: Unrecovered MR Resistance out of range error
1441	Servo: Recovered VCM Retract error
F442	Servo: Unrecovered VCM Retract error
1443	Servo: Recovered Load Retry error
F444	Servo: Unrecovered Load Retry error
1445	Servo: Recovered DFT Sharp error
F446	Servo: Unrecovered DFT Sharp error
1447	Servo: Recovered Load/Unload state error
F448	Servo: Unrecovered Load/Unload state error
1449	Servo: Recovered TFCR out-of-range error
F44A	Servo: Unrecovered TFCR out-of-range error
1501	Logical unit not ready
1502	Logical unit becoming ready
1503	Logical unit not ready - initializing command required
1504	Not ready - format in progress
1505	Not ready - self-test in progress
1506	Reassign failed
1507	Format failed
1509	Parameter list length error
150A	Invalid opcode in CDB
150B	LBA out of range
150C	Illegal request - invalid field in CDB
150D	Invalid LUN
150E	Illegal request - invalid field in parameter list
150F	Saved parameter not supported

UEC	Description
1510	Unsupported log page
1511	Unsupported enclosure services function (FC-AL only)
1512	Invalid message (SCSI only)
1513	System buffer full
1514	Not ready to ready transition
1515	Login reset (FC-AL only)
1516	Power on reset
1517	SCSI bus reset (SCSI), LIP reset (FC-AL), SAS Hard Reset (SAS)
1518	Bus device reset (SCSI), Target Reset (FC-AL), LUN Reset (SAS)
1519	Self initiated reset
151A	Tranceiver changed to single-ended (SCSI only)
151B	Tranceiver changed to LVD (SCSI only)
151C	Mode parameters changed
151D	Log parameters changed
151E	Reservations pre-empted
151F	Reservations released
1520	Registrations pre-empted
1521	Commands cleared by another initiator
1522	Microcode changed
1523	Inquiry parameters changed
1524	PFA threshold reached
1525	PFA test warning
1527	Synchronous data transfer error (SCSI only)
1528	ACK synchronization error (SCSI only)
1529	Unsupported LUN (SCSI only)
152A	Message reject error (SCSI only)
152B	Attention dropped too late (SCSI only)
152C	Message parity error rcvd when no message sent by target (SCSI only)
152D	Buffer CRC error on read
152E	Internal target failure
152F	Selection reselection error (SCSI only)
1530	Message parity error - initiator (SCSI only)
1531	Message parity error - target (SCSI only)
1532	Initiator detected error message received (SCSI only)
1533	Inappropriate or illegal message (SCSI only)
1534	Overlapped command attempted
1535	Miscompare during verify
1536	Reservation conflict
1537	Device identifier changed
1539	ESI: unspecified failure (FC-AL only)
153A	ESI: unsupported function (FC-AL only)

UEC	Description
153B	ESI: enclosure unavailable (FC-AL only)
153C	ESI: transfer failure (FC-AL only)
153D	ESI: transfer refused (FC-AL only)
153E	Data phase error
153F	Abort by LIP (FC-AL), Abort by OOB (SAS)
1540	Invalid release of persistent reservation
1541	Low power condition on
1542	SPC buffer not allocated
1543	IU SCSI CRC error
1544	Echo buffer overwritten
1545	Formatted with No P-List
1548	Hard Reset received
154A	Xfer Ready credit exceeded (FC-AL only)
154B	Transfer length error (FC-AL only)
1550	NAK rcvd (SAS)
1551	ACK NAK Timeout (SAS)
1552	Bad parameter offset (SAS)
1553	LUN Not ready, Notify (Enable Spinup) required (SAS)
1554	I_T_Nexus Loss Occurred (SAS)
1555	Initiator Response Timeout (SAS)
1556	ESI transfer failed - write ack (FC-AL)
1557	ESI transfer failed - read ack (FC-AL)
1558	ESI transfer failed - write ready (FC-AL)
1559	ESI transfer failed - read ready (FC-AL)
155A	ESI transfer refused - write ack (FC-AL)
155B	ESI transfer refused - read ack (FC-AL)
155C	ESI transfer refused - write ready (FC-AL)
155D	ESI transfer refused - read ready (FC-AL)
155E	ESI transfer failed - EDV (FC-AL)
1560	Too much write data (SAS)
1561	Information unit too short (SAS)
1562	Information unit too long (SAS)
1567	Insufficient registration resources
1568	End-to-End Data Protection Guard check
1569	End-to-End Data Protection Application Tag check
156A	End-to-End Data Protection Reference Tag check
156B	ECC error in DRAM customer data area
156C	Uncorrectable DRAM ECC error
F56C	Log dump data corrupt
F56F	Log dump data memory error
1570	Host interface CRC error

UEC	Description
1572	LUN not ready; manual intervention required
1573	Commands cleared due to power failure event (SAS)
1601	Channel/AE internal logic error
F602	Channel/AE hard logic error
F603	Channel/AE target failure
F604	Channel/AE calibration error
1606	Recovered data with PPM or precomp load
F607	Unrecovered data with PPM or precomp load
1608	Recovered data with TA (Thermal Asperity) detection
F609	Unrecovered data with TA detection
160A	Recovered data with SMM or VM or DDF
F60B	Unrecovered data with SMM or VM or DDF
160C	Recovered data with pre-PPM or FH (Fly Height) detection
F60D	Unrecovered data with pre-PPM or FH detection
160E	Recovered data with write or pre-TA detection
F60F	Unrecovered data with write or pre-TA detection
1610	Recovered data with pre-SMM or VM or STM or DDF
F611	Unrecovered data with pre-SMM or VM or STM or DDF
1612	Recovered data with NRZ parity error
F613	Unrecovered data with NRZ parity error
1614	Recovered parity PP correction or STW
F615	Unrecovered parity PP correction or STW
1616	Recovered channel error
F617	Unrecovered channel error
1618	Recovered AE thermal asperity found
F619	Unrecovered AE thermal asperity found
161A	Recovered AE open MR element error
F61B	Unrecovered AE open MR element error
161C	Recovered AE IC over temperature error
F61D	Unrecovered AE IC over temperature error
161E	Recovered AE IP clock count error
F61F	Unrecovered AE IP clock count error
1620	Recovered AE high MR current error
F621	Unrecovered AE high MR current error
1622	Recovered AE write data BLS error
F623	Unrecovered AE write data BLS error
1624	Recovered AE invalid head address error
F625	Unrecovered AE invalid head address error
1626	Recovered AE power supply error
F627	Unrecovered AE power supply error

UEC	Description
F629	Unrecovered AE open write head error
162A	Recovered AE write transition error
F62B	Unrecovered AE write transition error
162C	Recovered AE no write head current error
F62D	Unrecovered AE no write head current error
162E	Recovered Channel Pre-TA error
F62F	Unrecovered Channel Pre-TA error
1630	Recovered Channel write or NRZ parity error
F631	Unrecovered Channel write or NRZ parity error
1632	Recovered Channel Write Synth Unlock error
F633	Unrecovered Channel Write Synth Unlock error
1634	Recovered AE Short write read head error
F635	Unrecovered AE Short write read head error
1636	Recovered AE Short write head error
F637	Unrecovered AE Short write head error
1638	Recovered AE Non-selected write head error
F639	Unrecovered AE Non-selected write head error
163A	Recovered AE Write current in read error
F63B	Unrecovered AE Write current in read error
163C	Recovered AE IH Open short error
F63D	Unrecovered AE IH Open short error
163E	Recovered AE IH Deleay error
F63F	Unrecovered AE IH Deleay error
1640	Recovered AE Write head encode error
F641	Unrecovered AE Write head encode error
1642	Recovered AE Readback error
F643	Unrecovered AE Readback error
1644	Recovered Channel coarse tune timeout
F645	Unrecovered Channel coarse tune timeout
F701	Format corrupted
F702	Too many notches
D703	Auto-reallocated due to write error
1704	Recommend reassign due to write error
E705	Media error with OTF correction - reassigned
E706	Media error with OTF correction - recommend reassign
E707	Media error with OTF correction - recommend rewrite
D708	Media error with OTF correction - rewritten
1709	Media error with offline correction
D70A	Media error with offline correction - reassigned
E70B	Media error with offline correction - recommend reassign

UEC	Description
E70C	Media error with offline correction - recommend rewrite
E70D	Media error with offline correction - rewritten
E70E	Recovered Data Address Mark error - rewritten
E70F	Recovered Data Address Mark error - recommend rewrite
D710	Recovered Data Address Mark error - reassigned
E711	Recovered Data Address Mark error - recommend reassign
I712	Recovered ECC error
F713	Unrecovered ECC error
I714	Recovered sector overflow
F715	Unrecovered sector overflow
I716	Recovered overrun
F717	Unrecovered overrun
I718	Recovered abort immediate
F719	Unrecovered abort immediate
I71A	Recovered ECC overrun
F71B	Unrecovered ECC overrun
I7B8	Recovered Reference tag error
I71C	Recovered DRAM CRC error
F71D	Unrecovered DRAM CRC error
I71E	Recovered ID Parity error
F71F	Unrecovered ID Parity error
I720	Recovered sudden death
F721	Unrecovered sudden death
I722	Recovered small thermal asperity
F723	Unrecovered small thermal asperity
D724	Recovered thermal asperity w/offline correction - reassigned
E725	Recovered thermal asperity w/offline correction - recommend reassign
E726	Recovered thermal asperity w/offline correction - recommend rewrite
E727	Recovered thermal asperity w/offline correction - rewritten
E728	Recovered thermal asperity - rewritten
E729	Recovered thermal asperity - recommend rewrite
E72A	Recovered thermal asperity - recommend reassign
D72B	Recovered thermal asperity - reassigned
I72C	Recovered media error
F72D	Unrecovered media error
I72E	Recovered media error (off-line correction discarded)
F72F	Unrecovered media error (off-line correction discarded)
I731	Recovered Write Fault
F732	Unrecovered Write Fault
I733	Recovered read/write abort
F734	Unrecovered read/write abort

UEC	Description
1737	Recovered post write abort
F738	Unrecovered post write abort
1739	Recovered Post PES check write abort
F73A	Unrecovered Post PES check write abort
173B	Recovered data address mark error
F73C	Unrecovered data address mark error
173D	Recovered sector miss
F73E	Unrecovered sector miss
1746	Defect list format not supported
1747	Primary defect list not found
1748	Grown defect list not found
1749	Partial defect list transferred
F74B	Primary defect list error
F74C	Grown defect list error
F74D	Too many heads
F74E	Skew table size error
F74F	Too many zones
F750	Too many SIDs
F751	Alternate track table full
F752	Drive capacity too small
F753	G-list full (Format command)
F754	G-list full (2) (Format command)
F755	Pointer repeat size error
F756	DST slot size error
F757	P-list full
F758	Spare list full
1759	Unknown recovered error
F75A	Unknown unrecovered error
F75B	Too many sectors
F75C	Internal media access timeout
F75D	Selftest failed
F75E	Max servo cylinder too small
F761	Read/write command timeout
1770	Recovered SID timeout
F771	Unrecovered SID timeout
F772	DASH starting timeout
F773	ID table timeout
F774	Servo timeout
F775	Buffers timeout
F776	DASH done timeout
F777	DASH unknown timeout

UEC	Description
F77A	Unrecovered channel SBW timeout
F77D	Recovery timeout
1792	Recovered Current pointer error
1794	Recovered Drive DMA timeout error
F795	Unrecovered Drive DMA timeout error
1798	Recovered ID not found error
F799	Unrecovered ID not found error
F7B1	Overall Command Timeout
17B2	Recovered abort window error
F7B3	Unrecovered abort window error
17B4	Recovered shock sensor error
F7B5	Unrecovered shock sensor error
F7B9	Unrecovered Reference tag error
17B8	Recovered Reference tag error
17BA	Recovered Application tag error
F7BB	Unrecovered Application tag error
17BC	Recovered Guard check error
F7BD	Unrecovered Guard check error
17BE	Recovered Channel write synthesis unlock error
F7BF	Unrecovered Channel write synthesis unlock error
17C0	Recovered End sector check error
F7C1	Unrecovered End sector check error
17C2	Recovered Read CRC error
F7C3	Unrecovered Read CRC error
17C4	Recovered DRAM ECC error
F7C5	Unrecovered DRAM ECC error
17C6	Recovered DRAM ECC LBA error
F7C7	Unrecovered DRAM ECC LBA error
17C8	Recovered DRAM ECC Write error
F7C9	Unrecovered DRAM ECC Write error
F7D0	Pre-load timeout
17E0	Servo Recovered read/write abort estimator error
F7E1	Servo Unrecovered read/write abort estimator error
17E2	Servo Recovered read/write abort predictor error
F7E3	Servo Unrecovered read/write abort predictor error
17E4	Servo Recovered read/write abort PES error
F7E5	Servo Unrecovered read/write abort PES error
17E6	Servo Recovered read/write abort seek start error
F7E7	Servo Unrecovered read/write abort seek start error
17E8	Servo Recovered read/write abort PES reset error
F7E9	Servo Recovered read/write abort PES reset error

UEC	Description
17EA	Servo Recovered read/write abort SID unlock error
F7EB	Servo Unrecovered read/write abort SID unlock error
17EC	Servo Recovered read/write abort WCS other error
F7ED	Servo Unrecovered read/write abort WCS other error
17EE	Servo Recovered read/write abort hard reset
F7EF	Servo Unrecovered read/write abort hard reset
17F0	Servo Recovered read/write abort RV sensor error
F7F1	Servo Unrecovered read/write abort RV sensor error
17F2	Servo Recovered read/write abort RV sensor error
F7F3	Servo Unrecovered read/write abort RV sensor error
17F4	Servo Recovered read/write abort SHARP other error
F7F5	Servo Unrecovered read/write abort SHARP other error
17F6	Servo Recovered read/write abort SHARP exception error
F7F7	Servo Unrecovered read/write abort SHARP exception error
17F8	Servo Recovered read/write abort SVGA limit error
F7F9	Servo Unrecovered read/write abort SVGA limit error
17FA	Servo Recovered read/write abort gray code error
F7FB	Servo Unrecovered read/write abort gray code error
17FC	Servo Recovered read/write abort burst error
F7FD	Servo Unrecovered read/write abort burst error
17FE	Servo Recovered read/write abort no STM error
F7FF	Servo Unrecovered read/write abort no STM error

1AFF	SMART: Test warning (no sense)
2AFF	SMART: Test warning (recovered sense)
3AFF	SMART: Test warning (unit attn sense)
FCxx	Unable to read RID or FID number xx

## A

Abbreviations.....	117
abort sequence.....	57
abort task.....	111
Abort Task (Implemented as ABTS BLS).....	111
abort task set.....	111
Acoustics.....	43
Active Notch.....	188
Actuator.....	5
Additional information.....	309
Additional Sense Length (Byte 7).....	352
Address Discovery.....	77
address discovery (ADISC).....	77
Alternate Sectors per Zone.....	180
Alternate Tracks per Logical Unit.....	180
Alternate Tracks per Zone.....	180
Appendix.....	375
auto-contingent allegiance (ACA).....	112
Automatic Read Reallocation Enabled.....	174
Automatic Rewrite/Reallocate.....	329
Automatic Write Reallocation Enabled.....	174
autosense.....	113
Average latency.....	12

## B

basic accept (BA_ACC).....	58
Basic Link Services.....	57
basic link services.....	57
basic reject (BA_RJT).....	59
Block Descriptor.....	170
block format.....	121
Breather Hole.....	40
buffer overrun.....	161
buffer underrun.....	161
Byte ordering conventions.....	117
bytes from index format.....	123

## C

capability entry(s).....	87
Caution.....	1

class service parameters .....	68, 75
clear ACA .....	112
clear task set.....	112
Command Processing During Execution of Active I/O process.....	316
Command Processing During Startup and Format Operations.....	319
Command processing while reserved .....	327
Command Queuing .....	328
Command queuing.....	328
Command Reordering.....	328
Command reordering .....	328
Command Time out Limits.....	337
Common Fibre Channel Services .....	95
common service parameters.....	65
common transport (CT) interface .....	95
Concurrent I/O Process .....	328
concurrent sequences .....	70
Control Electronics .....	5
Cooling requirements.....	27
Corrosion test.....	26
cyclic redundancy check (CRC) .....	56
Cylinder switch time (Cylinder skew).....	12

## D

Data Integrity .....	15
Data Reliability .....	33
Data Sheet .....	7
Data transfer speed.....	13
DC Power Requirements .....	29
Defect Descriptor .....	121
defect descriptor.....	121
defect list.....	120
Deferred Error Condition.....	319
Degraded Mode.....	320
device cache fast writes .....	162
device cache partial read hits .....	162
device cache write hits .....	162
Diagnostics.....	333
Disable Block Descriptor.....	167
document identifier .....	88
